Enterprate Limited

Shared Deterministic First-Value & Premium Intelligence Framework

Product Requirements Document

Product decision

Give every new user a useful deterministic result before any premium gate. Premium plans unlock external research, enrichment, deeper analysis, blocker resolution and full intelligence packs. AI Credits meter eligible AI activity but never override plan entitlement.

Field	Value
Version	1.0
Status	Draft for Product & Engineering Review
Date	10 October 2026
Applies to	Idea Validation; Product/Service Launch Readiness; Funding Readiness; Pricing Intelligence; Customer Growth Opportunity
Commercial scope	Free deterministic first value + premium intelligence entitlement + AI Credit metering
Precedence	This PRD governs first-value, gating, entitlement, credit and cross-company-data reuse behaviour where recent feature PRDs conflict.

Important: adoption of this PRD should trigger targeted revisions to the affected feature PRDs. It does not replace their domain-specific calculation, evidence, scoring, simulation or action rules unless explicitly stated.

1. Executive Summary

EnterprateAI should not ask a new small-business owner to fill long forms before receiving value, and it should not spend substantial AI/research cost on free users before commercial intent is demonstrated. This PRD defines a common product pattern that solves both problems.

The adopted pattern is:

1	**User chooses a business goal or task.**
↓	
2	EnterprateAI runs a short, conversational context capture using only the few questions needed for the selected task.
↓	
3	**User verifies an account; the task is attached to the canonical Company/Business and existing data is reused.**
↓	
4	EnterprateAI runs a free deterministic first-value assessment using only user-confirmed answers and existing trusted Company data.
↓	
5	**The user receives an immediate result: score or foundation check, strengths, evidence coverage and blockers/gaps.**
↓	
6	The user can continue with relevant free/manual tools, save the task, or select the premium next action such as Resolve Blockers / Find My Best Price / Find Customer Opportunities.
↓	
7	**Premium entitlement is checked. If eligible, AI research/enrichment begins and AI Credits are metered according to the capability policy.**
↓	
8	Research outputs are reviewed by the user, adopted into a versioned dataset, and the deterministic engine reruns for the full result.
↓	
9	Follow-on tasks reuse the same Company data so each completed workflow improves future workflows.

Core distinction

Plan entitlement controls whether a premium intelligence capability is available. AI Credits control how much eligible AI work can be consumed. A free user having 50 AI Credits does not unlock a premium-only readiness or intelligence capability.

1.1 Why this matters

- **Better first value:** a visitor receives a concrete, explainable result before being asked to pay.
- **Lower AI cost exposure:** expensive market research and synthesis are reserved for entitled users.
- **Clear monetisation:** the paid upgrade unlocks resolution and deeper intelligence, not merely access to a form.
- **Stronger differentiation:** deterministic calculations, evidence, business history and cross-workflow data make the result more durable than one-off generic LLM advice.
- **Compounding product value:** confirmed Company data is reused across launch, funding, pricing, idea validation, growth and operational workflows.

2. Product Problem and Decision

2.1 Problems in the previous model

- Recent AI-native PRDs correctly moved away from long questionnaires, but some gated expensive intelligence before the user had received enough concrete value.
- Launch and Funding PRDs currently state that no readiness result is shown before dataset adoption. That conflicts with the new commercial requirement to provide a free deterministic first-value result before the premium gate.
- A credit-only gate is insufficient because the 50 free AI Credits could otherwise be interpreted as access to premium intelligence products.
- If every task creates its own duplicate data capture, the user repeatedly answers the same questions and EnterprateAI behaves like disconnected tools rather than a Company intelligence system.

2.2 Product decision

Decision

Every covered intelligence task must provide a bounded deterministic first-value result before premium research/enrichment. Premium entitlement is checked when the user asks EnterprateAI to resolve the identified blockers, enrich the evidence, benchmark the market, run advanced intelligence, or prepare the full pack.

3. Goals, Non-Goals and Product Principles

3.1 Goals

- Give new users meaningful value within minutes using deterministic logic and existing Company data.
- Reduce free-plan exposure to market research, LLM synthesis and other expensive intelligence work.
- Make plan entitlement and AI Credits independent, server-enforced controls.
- Reuse confirmed Company data across tasks and avoid duplicate records or repeated questions.
- Keep AI as a research, extraction, explanation and orchestration layer; keep scoring/calculation authority deterministic.
- Turn blockers into contextual premium conversion moments and follow-on tasks.
- Allow free users to continue making progress through appropriate manual/operational tools rather than a dead-end paywall.

3.2 Non-goals

- Giving free users unlimited market research or full premium intelligence packs.
- Allowing 50 free AI Credits to bypass subscription entitlements.
- Replacing deterministic engines with LLM-generated scores.
- Creating a new duplicate ontology or feature-specific Company profile for every workflow.
- Treating missing evidence as verified facts or fabricating inputs to complete an assessment.
- Guaranteeing customers, funding, launch success, profitability, market demand or investor outcomes.

3.3 Principles

Principle	Requirement
Value before gate	Show a concrete deterministic result before asking a new user to upgrade.
One Company, many workflows	Reuse canonical Company facts and confirmed records across tasks.
Ask only what is missing	Never ask for a current fact already known unless confirmation is required.
Unknown is not fabricated	Unknown/missing information remains explicit and becomes a blocker or evidence gap.
AI discovers; engines decide	AI may research/propose; deterministic services calculate scores/classifications.

Principle	Requirement
Human adopts business truth	Material researched/proposed facts require review before becoming authoritative.
Entitlement before credits	A user must first be entitled to the capability; credits meter eligible AI use after that.
No dead ends	If premium work is declined, offer save-for-later and relevant free/manual next steps.

4. Commercial Access and AI Credit Model

The platform must distinguish four different concepts. They must not be merged into one “credit balance” check.

Layer	Meaning	Example
Free manual capability	Underlying business tool can be used without AI execution.	Create a quotation manually; maintain Catalogue; add Customer/Vendor; publish permitted Marketplace listing.
Free deterministic first value	Bounded calculation/check using user answers + trusted Company data; no open market research.	Initial Launch Readiness; basic pricing health; Idea Viability first pass.
Premium plan entitlement	Whether a deeper intelligence capability can be used at all.	Full Launch Readiness Pack; Funding Readiness Intelligence; AI-enriched Pricing Intelligence.
AI Credit metering	Usage budget for eligible AI research/generation/automation inside allowed capabilities.	Market research, synthesis, agent-created invoice, AI drafting, advanced research run.

4.1 Server-side decision order

1. Resolve the requested capability.
2. Determine whether the requested action is free-manual, free-deterministic or premium-entitled.
3. If premium-entitled, validate the user plan before calculating AI Credit sufficiency.
4. If plan is eligible, calculate the configured credit cost and request/record authorisation where policy requires it.
5. Execute idempotently and charge only successful/chargeable events according to the central credit policy.
6. If plan is not eligible, show contextual upgrade plus permitted free/manual alternatives. Do not spend AI Credits.

Critical commercial rule

50 free AI Credits are a usage allowance, not a subscription entitlement. They can power eligible Agent assistance on free tools, but they cannot unlock premium-only Launch Readiness, Funding Readiness or equivalent intelligence products.

4.2 Free operational tools

The current GTM promise should remain: essential operational tools can be available without AI. The exact registry remains the source of truth, but expected free/manual examples include Catalogue, Customers, Vendors, Product/Service records, Marketplace listing where permitted, Invoice, Quotation and Contract. Proposal generation/submission must continue to follow Proposal Intelligence entitlement and must not be reclassified as free by this PRD.

A free user may spend their 50 AI Credits to ask the Agent to help with an otherwise free operational tool, where that Agent action is registered and eligible. Example: the Invoice tool is free manually; “create this invoice for me” may consume configured AI Credits.

5. Shared End-to-End Intelligence Workflow

Stage	User experience	Cost / access treatment
1. Goal	Selects or types a goal.	Free; no credits.

Stage	User experience	Cost / access treatment
2. Short conversation	Approximately 5-6 high-value questions, fewer if Company data already exists.	Free; no expensive external research.
3. Verify	Email verification / account resolution; preserve context.	Free.
4. Company reuse	Load relevant confirmed Company records and prior assessments.	Free system retrieval.
5. Deterministic first value	Run bounded calculations/checks using current evidence only.	Free deterministic service.
6. Result	Show score/check, evidence coverage, strengths and blockers.	Free.
7. Premium CTA	Resolve blockers / Find best price / Find customer opportunities / Prepare full pack.	Entitlement gate.
8. Research & enrichment	External research, AI synthesis, benchmarking and evidence gathering.	Premium + AI Credits as configured.
9. Review & adopt	Accept/Edit/Reject researched items; adopt versioned dataset.	Human control.
10. Full deterministic reassessment	Run official engine/rules against adopted data.	Entitled feature; engine remains authoritative.
11. Follow-on execution	Use resulting data for Marketplace, quote, business plan, funding materials, etc.	Per capability entitlement/credit rules.

5.1 First-value result contract

Every covered task must return a structured first-value object even when information is incomplete. The result is provisional unless the feature already defines the free deterministic output as final.

Field	Required behaviour
assessment_type	Task-specific type: idea_viability_initial, launch_readiness_initial, funding_readiness_initial, pricing_health_initial, customer_growth_foundation.
basis	User-confirmed answers + existing trusted Company records only.
ruleset_version	Required for reproducibility.
score/check	Numeric score only where the task has a valid deterministic model; otherwise a foundation count/check.
evidence_coverage	Show how much of the required evidence is known/usable. Keep separate from readiness.
criterion states	met / partially_met / unmet / unknown / not_applicable as supported.
blockers/gaps	Explicit missing, unknown or failed items; distinguish unknown from failed.
strengths	What is already supported by current evidence.
premium_next_action	Contextual action that explains what deeper intelligence will do.
free_next_actions	Relevant manual/free actions from the current capability registry.

5.2 Score and evidence rule

Do not hide uncertainty

A first-value score must never imply that missing data is known. For readiness products, unknown mandatory criteria remain explicit and can reduce the current/provisional preparation score or block a Ready classification according to the feature rules. Evidence Coverage is shown beside the score. For features where a defensible score cannot be computed, return “Insufficient evidence” plus the deterministic foundation/gap result instead of inventing a number.

6. One Company Data Model and Cross-Workflow Reuse

The business should become progressively easier to use. Once a fact has been confirmed and stored in the correct authoritative record, later workflows should reuse it rather than ask again. Assessment snapshots remain immutable, while canonical Company records can evolve with provenance and history.

Data captured once	Authoritative / likely source	Reused by
Offering description / category	Offering / Catalogue	Idea Validation, Launch, Pricing, Customer Growth, Funding, Marketplace, Proposal/Quotation
Target customer / segment	CustomerSegment / MarketProfile	Idea, Launch, Customer Growth, Funding, Proposal
Price / pricing model	Offering + PricingModel	Pricing, Viability, Launch, Marketplace, Quotation, Funding

Data captured once	Authoritative / likely source	Reused by
Direct and fixed costs	Financial records / cost assumptions	Idea Viability, Pricing, Launch, Funding, Simulation
Demand evidence	DemandEvidence / linked records	Idea, Launch, Customer Growth, Funding
Customers / opportunities	Customer / Opportunity	Growth, Funding traction, Stability, Proposal and sales workflows
Quotations / invoices / contracts	Business Operations	Traction, revenue evidence, Funding, Growth, Stability
Capacity and dependencies	CapacityProfile / operational records	Launch, Pricing volume, Funding, Stability
Channels / Marketplace state	Channel / Marketplace records	Customer Growth, Launch, Growth Engine
Cash / revenue / expenses	Financial domain	Funding, Survival, Simulation, Launch cash preparation
Previous assessments	Assessment snapshots	Adaptive Dashboard, reassessment, scenarios, follow-on recommendations

6.1 Write policy

- Pre-auth conversational values remain in task/session draft state and do not create permanent private business records.
- After authentication, user-entered facts may be persisted according to existing write policy; AI-researched or inferred facts remain proposed until accepted where material.
- Before creating reusable entities such as Offering, Customer or PricingModel, match against existing authorised records to prevent duplicates.
- Never overwrite a canonical business fact silently from an LLM output or external source.
- Every material field used in an assessment retains provenance, data basis, timestamp/freshness and confidence/review state.

7. Task Workflow: Idea Validation

7.1 Goal

Give a founder a real first-pass viability result without external research, then convert the strongest gaps - demand evidence, competitor context and uncertain assumptions - into premium intelligence work.

7.2 Short conversation

#	Question	Reuse / notes
1	What is your product/service idea?	Reuse existing Offering draft if present.
2	Who is it for and where?	Reuse CustomerSegment / market scope.
3	What price are you thinking of charging and roughly how many could you sell each month?	Allow “not sure” but a viability score may remain incomplete.
4	Roughly what does one sale cost you, plus any new monthly fixed costs?	Use existing cost records where applicable.
5	How much could you realistically deliver each month / what capacity do you have?	Map to capacity assumptions.
6	What evidence of demand do you already have?	Assumption, research, enquiries, LOIs, pilot, paying or repeat customers.

7.3 Free deterministic value

When the required inputs are available, reuse the existing Viability Engine. Its current calculation set already includes monthly revenue, contribution, margin, break-even, capacity feasibility and demand evidence. The score is deterministic, explainable and reproducible.

Metric / score	Derivation
Monthly revenue	price_per_sale × expected_sales_per_month
Variable cost	variable_cost_per_sale × expected_sales_per_month
Contribution per sale	price_per_sale − variable_cost_per_sale
Contribution margin	(revenue − variable cost) ÷ revenue
Break-even sales	monthly_fixed_cost ÷ contribution_per_sale, when contribution > 0
Break-even months	break_even_sales ÷ expected_sales_per_month
Capacity utilisation	expected_sales_per_month ÷ capacity_sales_per_month
Demand score	Evidence ladder: assumption < research < enquiries < LOIs < paid pilot < paying < repeat customers
Viability score	35% margin + 25% break-even + 25% demand + 15% capacity

Outcome bands remain Very Strong / Strong / Fair / Weak where the existing engine has sufficient inputs. If a required component cannot be calculated, show the calculable metrics, evidence coverage and the missing blocker rather than fabricate a full score.

7.4 Example first value

Initial Idea Viability - Fair

Viability 68/100 · Evidence coverage 60%
Strengths: workable margin; delivery capacity appears feasible.
Blockers: demand is largely unproven; competitor pricing is unknown; expected sales assumption is unvalidated.
Primary CTA: Validate the weak points.

7.5 Premium AI unlock

- Competitor and substitute research.
- Comparable price ranges and positioning.
- External demand/market evidence and trend research.

- Customer problem and segment refinement.
- Evidence-backed assumption proposals.
- Scenario preparation for price/demand/cost changes where entitled.

7.6 Follow-on tasks

Launch Readiness → Pricing Intelligence → Business Plan → Marketplace Listing → Customer Growth Opportunity → Funding Readiness.

8. Task Workflow: Product/Service Launch Readiness

8.1 Short conversation

#	Question
1	What are you launching - product, service or both?
2	Briefly describe it.
3	What stage is it at - idea, prototype, testing or ready?
4	Who is it for?
5	Where and when do you want to launch?
6	What customer testing or demand evidence do you already have?

8.2 Free deterministic value

Reuse the current Launch Readiness commercial-service criteria where data is available. The first-value run is not the full Launch Dataset research workflow. It is a bounded assessment of what the Company already knows.

Criterion	Weight	Free first-value basis
Customer and demand	15	Target segment/problem + existing dated demand evidence and its review state.
Offer and pricing	15	Launch scope, known price/terms, known cost and margin inputs.
Cash preparation	20	Existing forecast/cash inputs if present; otherwise unknown blocker.
Delivery capability	15	Planned demand versus evidenced available capacity/dependencies.
Operational process	10	Known enquiry/order-to-delivery/payment process and any existing dry-run evidence.
Applicable prerequisites	10	Known obligations/prerequisites and completion evidence; unknown remains unknown.
Route to market	10	Known acquisition channel/audience/message/owner/budget/target.
Launch control	5	Known milestones/date/owners/success measures/incident response/review date.

Existing blocker logic remains authoritative: known cash shortfall, demand above confirmed capacity, known missing critical prerequisite, failed critical end-to-end test, or non-positive contribution can block readiness. Unknown required evidence must be shown as unknown, not passed.

8.3 Example first value

Initial Launch Readiness - 57/100

Evidence coverage 52%
Ready now: offer is defined; target customer identified; launch market selected.
Blockers / gaps: demand not validated; pricing economics incomplete; delivery capacity unknown; launch channel not defined.
Primary CTA: Resolve my 4 launch blockers.

8.4 Premium AI unlock

- Market demand and competitor research.
- Comparable pricing and market-position evidence.
- Suggested launch channels and audience evidence.

- External prerequisite research where a maintained rules profile permits it.
- Evidence gathering and proposed assumptions with provenance.
- Scenario analysis and blocker-resolution guidance.
- Preparation of the full reviewed Launch Dataset and Launch Readiness Pack.

8.5 Follow-on tasks

Publish permitted Marketplace listing → Pricing Intelligence → Customer Growth → Quotation/Proposal → Launch monitoring → Funding Readiness where funding is a launch dependency.

9. Task Workflow: Funding Readiness

9.1 Short conversation

#	Question
1	How much funding do you think you need? (“I’m not sure” is allowed.)
2	What do you need the money for?
3	What stage is the business at?
4	What funding route are you considering - equity, loan, grant or not sure?
5	When do you need the funding?
6	What traction do you currently have - customers, revenue, pilots, contracts or other evidence?

9.2 Free deterministic value

Reuse the current Funding Readiness criterion structure for the implemented route/profile. For the existing first-release equity-preparation profile, the free snapshot should evaluate what can be established from the short conversation plus existing Company records.

Criterion	Weight	Free first-value basis
Funding purpose	10	Known target amount/currency/date and link to a measurable purpose/milestone.
Use of funds	15	Existing allocations and reconciliation; otherwise a structured gap.
Financial preparation	20	Existing monthly forecast, assumptions and source completeness.
Demand evidence	15	Existing dated customer/market evidence and relevance.
Business economics	10	Existing pricing, direct/fixed costs, break-even/capacity findings.
Market and growth plan	10	Known target segment, differentiation and acquisition approach.
Team and delivery	10	Named execution responsibility plus material capacity/dependency gaps.
Materials and risks	10	Existing preparation documents, known risks and funding-timing issues.

Route-specific gates remain authoritative. If a required check is unknown, it must not be treated as passed. The free result is a preparation snapshot, not a claim about likelihood of securing funding.

9.3 Example first value

Initial Funding Preparation - 48/100

Evidence coverage 43%
Strengths: funding purpose defined; business stage clear; some customer evidence exists.
Funding blockers: amount not evidenced; use of funds not structured; forecast missing; traction evidence incomplete; investor materials incomplete.
Primary CTA: Help me become funding-ready.

9.4 Premium AI unlock

- Funding-route research for supported profiles.
- Sector/market evidence and benchmark research.
- Proposed use-of-funds structure and milestone logic.
- Forecast assumption preparation and scenario support.
- Gap-resolution work across evidence, materials and narrative.
- Executive summary, pitch content and other permitted funding materials.
- Full reviewed Funding Dataset and deterministic reassessment.

9.5 Follow-on tasks

Business Plan → Forecast → Executive Summary → Pitch Materials → Scenario Simulation → Reassess Funding Readiness. Existing Company traction from Marketplace, quotations, invoices, customers and contracts should automatically strengthen later evidence where applicable.

10. Task Workflow: Pricing Intelligence

10.1 Short conversation

#	Question
1	What are you pricing?
2	Who are you selling it to?
3	What price are you considering or currently charging?
4	Approximately what does one sale cost you to deliver?
5	How many could you realistically sell/deliver each month?
6	How do you want to position it - affordable, mid-market, premium or not sure?

10.2 Free deterministic value

Before any market research, EnterprateAI can calculate real economics from the user's own numbers and existing Company data.

Metric	Derivation / interpretation
Contribution per sale	Price – direct/variable cost per sale.
Contribution margin	Contribution ÷ price.
Monthly contribution	Contribution per sale × expected monthly volume.
Break-even sales	Relevant fixed costs ÷ contribution per sale, where fixed costs are known and contribution is positive.
Capacity utilisation	Expected volume ÷ available capacity when capacity is known.
Pricing health	Deterministic interpretation of margin/break-even/capacity; not a market price recommendation.

10.3 Example first value

Pricing Health

Proposed price £100 · Cost per sale £45 · Contribution £55 · Margin 55% - strong.
At 20 sales/month: £1,100 contribution before relevant fixed costs.
Missing market intelligence: comparable prices; customer price sensitivity; competitor positioning; demand impact at alternative prices.
Primary CTA: Find my best price.

10.4 Premium AI unlock

- Competitor/substitute price research.
- Market price bands and positioning evidence.
- Customer willingness/price-sensitivity evidence where supportable.
- Market-demand evidence and comparative positioning.
- Scenario Engine testing of alternative prices after the user reviews/adopts the relevant assumptions.
- Sensitivity analysis, breakpoint detection and safe-zone identification where supported.

The LLM does not decide the adopted price. The user chooses; the Scenario Engine calculates impact; the PricingModel is updated only after explicit approval.

10.5 Follow-on tasks

Adopt Price → Update Catalogue/PricingModel → Marketplace Listing → Quotation templates → Invoice → Launch Readiness → Customer Growth.

11. Task Workflow: “I Need More Customers”

11.1 Product boundary

EnterprateAI must not promise to acquire or guarantee customers. The free first value checks whether the business has the foundations required to pursue customer growth and uses existing Company data to identify obvious gaps.

11.2 Short conversation

#	Question
1	What do you sell?
2	Who do you believe your ideal customers are? (“I’m not sure” is allowed.)
3	Where do you want to find customers?
4	How do customers currently find you? (“I don’t have customers yet” is allowed.)
5	What do you typically charge / what is a typical customer worth?
6	What would success look like over the next three months?

11.3 Free deterministic value

Do not invent a generic “customer growth score” unless a validated model is later created. Version 1 uses a deterministic Customer Growth Foundation Check.

Foundation check	Pass / gap rule
Offer exists	A current Offering/Catalogue item exists or was confirmed in conversation.
Offer clarity	Description/value proposition is sufficiently populated for use in sales/Marketplace.
Target customer	A customer segment or usable target definition exists.
Price readiness	A current price or price basis exists.
Acquisition channel	At least one current/planned customer acquisition channel exists.
Marketplace visibility	Marketplace profile/offering is published/enabled where relevant.
Sales execution path	Quotation/proposal/enquiry path is available according to capability entitlement.
Traction evidence	Customer, opportunity or DemandEvidence record exists.
Growth goal	A time-bound numeric or clearly measurable goal exists.

11.4 Example first value

Customer Growth Foundation - 5 of 9 in place

In place: offer defined; price defined; target region identified; quotation path ready; growth goal set.
Gaps: ideal customer too broad; no active Marketplace listing; no defined acquisition channel; limited demand evidence.
Primary CTA: Find my best customer opportunities.

11.5 Premium AI unlock

- External market and segment research.
- High-potential target segment identification.
- Customer problem and demand-signal research.
- Competitor/positioning gaps.
- Channel and geography opportunity research.
- Relevant Marketplace opportunity discovery where permitted.
- Customer Growth Opportunity Brief with evidence and prioritised next actions.

11.6 Follow-on tasks

Improve Offering → Publish/Update Marketplace → Create Quotation → Prepare Proposal where entitled → Add Opportunity → Convert Customer → Contract → Invoice. These transactions then become stronger evidence for later Customer Growth, Funding and Stability assessments.

12. UX Requirements

12.1 Novice-first experience

- One conversational question at a time where possible; avoid “0 of 10 fields answered” as the main experience.
- Show a small progress indicator for the short conversation; do not expose ontology fields or engine names.
- After verification, do not drop the user into an empty dashboard. Continue directly to the deterministic first-value result.
- Use plain language: “What looks ready”, “What is missing”, “Your blockers”, “What I can help you resolve”.
- The upgrade gate appears after value, not before value.
- Always explain what the premium step will do and why it is more valuable than the free snapshot.

12.2 Free result screen

Area	Requirement
Headline	Task-specific result: Initial Launch Readiness, Initial Funding Preparation, Pricing Health, Idea Viability, Customer Growth Foundation.
Primary result	Score/classification or foundation count where valid.
Evidence coverage	Always separate from score when the assessment depends on missing evidence.
Strengths	2-4 concise supported positives.
Blockers/gaps	Prioritised; distinguish failed vs unknown/missing.
Primary CTA	Resolve blockers / Become funding-ready / Find my best price / Validate weak points / Find customer opportunities.
Secondary	Save for later; view details; permitted free/manual next actions.

12.3 Premium gate screen

Example gate

You already have an initial assessment. I can now research the missing evidence, benchmark your market, test assumptions and help resolve the blockers. Full Launch Readiness Intelligence is available on an eligible plan.

Primary: Upgrade to resolve blockers
Secondary: Continue with free tools · Save for later

13. Premium Research, Enrichment and Adoption Contract

Premium AI work must be structured and evidence-aware rather than a single open-ended “research this business” prompt.

Research field state	Meaning
Existing Company data	Current authoritative record; reuse unless stale or conflicting.
User confirmed	Directly confirmed by an authorised user.
Researched	External evidence with source/date and confidence.
Estimated / benchmark	Proposed value derived from evidence/benchmark; never silently converted to fact.
Calculated	Deterministically derived from known inputs.
Evidence verified	Supported by governed evidence/reviewer policy.
Missing	Required information is not available.
Conflicted	Sources disagree; human review required.

13.1 Review and adoption

- Material researched/estimated fields are shown with Accept / Edit / Reject or equivalent review controls.
- Private business facts that cannot be inferred from public information require business confirmation.
- Adoption creates an immutable assessment input snapshot; it does not silently overwrite unrelated live business records.
- Where the user chooses to update a canonical Offering, PricingModel or other business record, that is a separate explicit approved write with provenance.

14. Follow-on Task Graph and Compounding Intelligence

A result should create the next useful action, not another isolated report. The same Company data should strengthen subsequent tasks.

Starting task	Typical follow-on tasks	Data gained for future use
Idea Validation	Pricing → Launch → Marketplace → Customer Growth → Funding	Offering, assumptions, demand evidence, cost/capacity inputs.
Launch Readiness	Pricing → Marketplace → Quotation/Proposal → Customer Growth	Launch initiative, target date, prerequisites, channels, capacity, demand evidence.
Pricing	Catalogue → Marketplace → Quote → Invoice → Launch	Confirmed PricingModel and economics.
Customer Growth	Marketplace → Opportunity → Quote/Proposal → Contract → Invoice	Segments, channels, opportunities, customers, conversion/traction evidence.
Funding Readiness	Business Plan → Forecast → Materials → Scenario → Reassess	Funding case, use of funds, forecast, milestones, evidence, materials.

Compounding-value principle

The second EnterprateAI task should usually require fewer questions than the first. By the time a business reaches Funding Readiness after using Catalogue, Marketplace, quotations, invoices and Launch Readiness, a meaningful share of the evidence should already exist in the Company model.

15. Capability, Entitlement and Credit Registry

Commercial behaviour must be configuration-driven. Do not hard-code “8 credits”, plan names or free/premium decisions inside individual UI components.

Required capability metadata	Purpose
capability_id	Stable identifier for task/action.
availability_class	free_manual / free_deterministic / premium_intelligence / agent_automation.
required_plan_or_entitlement	Plan/feature gate. Null only when truly free.
credit_policy_id	Reference to current AI Credit cost/metering rule.
supports_free_fallback	Whether contextual free/manual alternatives should be generated.
allowed_fallback_capabilities	Registered safe next-best actions.
input_contract	Required/optional data and Company sources.
output_contract	Result type and authoritative owner.
approval_policy	Human approval requirements for writes/external actions.

16. Analytics and Success Measures

Metric	Definition / intent
Goal-to-first-value rate	Visitors who complete the short conversation and receive a deterministic result.
Time to first value	Median time from goal selection to deterministic result.

Metric	Definition / intent
First-value usefulness	User feedback / continuation after free result.
Blocker CTA rate	Users selecting Resolve Blockers / premium next action.
Upgrade conversion	Free-result users who upgrade to the required plan.
Premium intelligence completion	Entitled users who complete research → review → adopt → reassess.
Data reuse rate	Percentage of task inputs satisfied from existing Company data rather than re-entry.
Questions avoided	Count of candidate questions skipped because trusted Company data already existed.
Free-to-operational continuation	Users who decline upgrade but use a relevant free/manual tool.
AI cost per converted premium workflow	AI/research cost divided by completed premium intelligence workflows.
Follow-on activation	Users starting a related task from the result.

17. Security, Privacy, Evidence and Safety

- No cross-business or cross-tenant data reuse. Company context is always scoped to authorised membership and role.
- External research content is untrusted input and must not be permitted to issue tool instructions or override system policy.
- Public research must not be used to infer private cash, bank balances, ownership, signed commitments or other business-confidential facts.
- Every assessment stores ruleset version, raw inputs/snapshot reference, data timestamp, outputs and provenance needed for reproducibility.
- Scenarios remain non-mutating until an authorised user explicitly adopts a live change.
- Consequential writes and external actions follow the Agentic Orchestration approval policy.

18. Functional Requirements

ID	Requirement
SIF-01	All covered tasks use the shared goal → short conversation → verify → Company reuse → deterministic first-value → premium CTA pattern.
SIF-02	Short conversation is approximately 5-6 questions and dynamically omits known current Company facts.
SIF-03	The first-value assessment performs no open-ended external market research.
SIF-04	Every first-value result exposes strengths plus missing/failed blockers and evidence coverage where relevant.
SIF-05	Plan entitlement is evaluated before AI Credit sufficiency for premium intelligence.
SIF-06	Free AI Credits cannot bypass a premium feature entitlement.
SIF-07	Declining upgrade provides Save for later plus registered free/manual alternatives where relevant.
SIF-08	AI research fields retain source, timestamp, basis and confidence and remain proposed until the governing review policy is satisfied.
SIF-09	Deterministic engines calculate task scores/classifications; LLM narrative cannot override them.
SIF-10	Canonical Company data is reused across tasks with duplicate prevention and provenance.
SIF-11	Assessment snapshots are immutable and reproducible by ruleset/version.
SIF-12	Idea Validation reuses existing viability formulas and risk flags rather than introducing a second viability score.
SIF-13	Launch and Funding free snapshots reuse their existing criteria and blockers/gates where possible.
SIF-14	Pricing free snapshot gives economic health but does not claim a market-recommended price before benchmark/research evidence.
SIF-15	Customer Growth uses a foundation check, not a fabricated predictive customer-acquisition score.
SIF-16	Follow-on tasks receive references to relevant canonical Company records and prior assessment snapshots.
SIF-17	All credit costs, entitlements and fallback actions are registry/configuration driven.
SIF-18	Manual free tools remain usable independent of AI Credit balance where product policy marks them free.

19. Acceptance Criteria

- A brand-new user can receive a deterministic first-value result for each covered task without paying and without external research being executed.

- A free user with 50 AI Credits cannot start a premium-only Launch/Funding/Pricing/Customer-Growth enrichment workflow solely because the credit balance is sufficient.
- A paid/entitled user with insufficient credits receives the configured credit pathway without losing task progress.
- Launch first-value shows score/coverage/blockers from existing data; premium research is not required merely to display the initial snapshot.
- Funding first-value shows preparation score/coverage/gaps from current evidence and does not claim probability of raising funds.
- Idea Validation returns the existing deterministic viability metrics when minimum inputs are available; missing inputs are explicit otherwise.
- Pricing free value returns contribution/margin/break-even/capacity metrics where calculable and does not claim competitor-based optimal price before research.
- Customer Growth returns the 9-foundation check and does not guarantee customers or fabricate a predictive acquisition score.
- If the same Offering, target customer or price already exists in the Company, later tasks reuse it and do not ask the user to re-enter it without a valid reason.
- A researched value rejected by the user does not become an authoritative Company fact.
- A follow-on task can reuse approved data and assessment references without copying them into a new silo.
- Narrative/LLM failure does not remove the deterministic result.
- Retries do not duplicate AI Credit charges, actions, evidence or assessment snapshots.

20. Required Revisions to Recent PRDs

On adoption, this PRD becomes the shared authority for first-value, gating, entitlement and cross-task data reuse. The following feature PRDs need targeted revisions rather than full rewrites.

PRD	Required revision
AI-Native Product & Service Launch Readiness v1.0	Replace “no readiness score before adoption” with a free provisional deterministic snapshot before premium research. Retain adopted-dataset rule for the full/official premium assessment. Replace promotional/free research ambiguity with premium entitlement.
AI-Native Funding Readiness v1.0	Add free preparation snapshot before premium research; remove any optional first included research run. Keep deterministic gates and adopted Funding Dataset for the full assessment.
AI-Native Customer Growth Opportunity v1.0	Add free 9-foundation check before research; gate external opportunity research/segmentation behind plan entitlement. Keep honest no-guarantee boundary.
AI-Native Pricing Intelligence v1.0	Move the gate after free deterministic Pricing Health. Gate market benchmarking, competitor research and scenario-rich intelligence. Preserve free/manual fallback.
Goal-Driven Conversational Onboarding v2.0	Clarify that goal interpretation and short conversation are free; first-value deterministic checks are also free for registered covered tasks; plan entitlement precedes AI Credit checks.
Idea Validation / Viability experience	Define deterministic first-pass validation as free; external demand/competitor enrichment and advanced intelligence are premium according to entitlement registry.

21. Engineering Implementation Plan

21.1 Phase 0 - Production discovery only

7. Inventory current Goal Resolver, TaskSession, auth/verification, Company/Business resolution and onboarding state.
8. Inventory current entitlement and AI Credit services and identify the authoritative server-side enforcement points.
9. Map the existing Idea Viability, Launch Readiness, Funding Readiness, Pricing/Scenario and Customer Growth-relevant services to this PRD.
10. Map canonical Company entities and identify where recent PRDs introduced conceptual structures that production already supports.

11. Return a Reuse / Extend / Replace matrix before schema changes or feature code.

21.2 Recommended implementation sequence

12. Implement shared capability availability/entitlement metadata and server-side check order.
13. Implement shared deterministic-first-value result contract and UI shell.
14. Implement Idea Validation first because the deterministic engine already exists.
15. Implement Pricing Health free snapshot using existing economics, then premium research gate.
16. Implement Launch initial snapshot using existing Launch rubric and Company data.
17. Implement Funding initial snapshot using existing Funding rubric and Company data.
18. Implement Customer Growth Foundation Check and premium research handoff.
19. Implement shared cross-task data reuse tests, duplicate prevention and follow-on deep links.
20. Revise feature PRDs and regression fixtures to match the adopted shared behaviour.

21.3 Regression protections

- Existing manual Invoice, Quotation, Contract, Catalogue, Customer, Vendor and Marketplace flows remain usable according to current entitlement policy.
- Marketplace Claim and homepage onboarding still converge on the same canonical Company/Business.
- Existing premium Proposal Intelligence entitlement is not weakened.
- Existing deterministic engine thresholds/formulas are not silently changed by the UX/gating refactor.
- Historic assessment snapshots remain reproducible after introducing the new free initial snapshot type.

22. Definition of Done - Version 1

- All five covered intelligence tasks expose a short conversation and deterministic first value before premium research.
- The first-value layer is demonstrably usable with LLM/research services unavailable.
- Entitlement and AI Credit checks are separate, server-enforced and configuration-driven.
- Free users cannot use free credits to bypass premium feature access.
- Relevant free/manual alternatives remain available after an upgrade decline.
- Company data is reused across tasks with provenance and duplicate prevention.
- Premium AI research results are reviewed/adopted before material use in full deterministic reassessment.
- Follow-on tasks receive stable references to approved Company records and assessment snapshots.
- Analytics measure first value, upgrade conversion, data reuse and AI cost efficiency.
- Affected recent PRDs are updated to reference this shared framework and remove conflicting gate behaviour.

23. Final Product Model

1	**BUSINESS OWNER STATES A GOAL**
↓	
2	ENTERPRATEAI ASKS ONLY THE MINIMUM CONTEXT QUESTIONS
↓	
3	**VERIFY / RESOLVE THE COMPANY**
↓	
4	REUSE EXISTING COMPANY DATA
↓	
5	**RUN FREE DETERMINISTIC FIRST-VALUE LOGIC**
↓	

6	SHOW VALUE + EVIDENCE COVERAGE + BLOCKERS
↓	
7	**USER CHOOSES: FREE/MANUAL NEXT STEP OR PREMIUM "RESOLVE / ENRICH" ACTION**
↓	
8	CHECK PLAN ENTITLEMENT → THEN AI CREDIT POLICY
↓	
9	AI RESEARCHES / ENRICHES / PREPARES EVIDENCE
↓	
10	HUMAN REVIEWS AND ADOPTS
↓	
11	DETERMINISTIC ENGINE RUNS THE FULL ASSESSMENT / SCENARIO
↓	
12	FOLLOW-ON TASKS REUSE THE SAME COMPANY DATA

EnterprateAI differentiation

AI discovers and prepares evidence. The Business Ontology remembers it. Deterministic engines calculate the decision. The human approves it. Subsequent workflows reuse it. This is the core behaviour that must make EnterprateAI more useful over time than a one-off generic LLM conversation.

24. Source Alignment and Precedence

This PRD was prepared to align the revised commercial/gating decision with the existing EnterprateAI architecture and recent feature PRDs. Domain-specific formulas, criteria, gates and ontology ownership remain governed by their owning specifications unless this document explicitly changes first-value/gating behaviour.

- Goal-Driven Conversational Onboarding PRD v2.0 - outcome-led entry, zero-credit routing, canonical Company convergence and no duplicate questions.
- Shared Architecture and Feature Integration Blueprint v0.1 - shared assessment contract, canonical records, evidence/missing/blocker separation, modular reuse and immutable snapshots.
- Updated Business Ontology - shared Offering, PricingModel, Customer, Opportunity, DemandEvidence, financial, operational, market and decision entities.
- Service Idea Viability Engine - deterministic economics, demand, capacity, viability score and risk flags.
- Launch Readiness PRD v0.1 / AI-Native Launch Readiness v1.0 - eight launch criteria, blockers, evidence and AI-native acquisition flow.
- Funding Readiness PRD v0.1 / AI-Native Funding Readiness v1.0 - eight funding criteria, gates, evidence, use-of-funds and AI-native preparation flow.
- AI-Native Customer Growth Opportunity PRD v1.0 - honest customer-growth boundary and research/action workflow.
- AI-Native Pricing Intelligence PRD v1.0 - pricing conversation, economic/market intelligence split, credit/entitlement concerns and free/manual fallback.
- Real-Time Simulation Engine - non-mutating scenarios, sensitivity analysis, breakpoints and safe-zone identification.
