

IDEA VALIDATION LOGIC UPDATE

The current form provides a useful foundation by capturing the idea, problem, affected customer, alternatives, proposed solution, market, geography and early evidence. However, the redesigned wizard must collect additional information conditionally so that EnterprateAI does not apply the same validation logic to a SaaS product, marketplace, event, professional service, physical product or nonprofit.

One technical guardrail is essential:

An LLM without live retrieval cannot independently verify current market facts.

Therefore, the free plan may provide indicative market intelligence, but it must label it **“LLM-generated — not live verified.”** The **Verified** status must be reserved for data retrieved, opened and checked through the paid plan’s external research services. The system must never fabricate a source URL to make an estimate appear verified.

1. Development and Implementation

Master Prompt

Copy the following prompt into the development environment or coding agent being used by your team.

MASTER DEVELOPMENT PROMPT

PROJECT:

EnterprateAI Product

FEATURE:

Credible Universal Idea Validation Engine

VERSION:

Idea Validation Engine v4.0

PRIMARY OBJECTIVE

Redesign and implement EnterprateAI's Idea Validation module so it can evaluate different types of business, product, service, nonprofit, platform and commercial ideas credibly, consistently and transparently.

The module must support two user-selected validation journeys:

1. Basic Validation
2. Comprehensive Validation

The module must also behave differently according to the user's subscription plan:

1. Free plan:
 - LLM reasoning only.
 - No live external market-research APIs.
 - External facts cannot be described as live verified.
 - Market estimates may be generated only as indicative assumptions.
 - All such figures must be labelled "LLM-generated — not live verified."
 - Do not fabricate source URLs.
 - Where verification is required, display "External verification required."
2. Paid plan:
 - May use approved external research APIs, live web retrieval, company databases, official statistics and market data sources.
 - All external claims must include a source, direct URL, publisher, publication date, access date and verification status.
 - Market and competitor claims must be checked before being labelled verified.

ARCHITECTURAL PRINCIPLES

EnterprateAI must continue to operate as a deterministic business intelligence platform rather than an unrestricted AI report generator.

The system architecture must follow this sequence:

Structured User Inputs

- Idea-Type Classification
- Business Ontology Mapping
- Evidence Collection

- Market Research Layer
- Deterministic Computation Engine
- Validation Scoring Engine
- Contradiction and Integrity Checks
- Risk and Fragility Analysis
- Recommended Simulations
- LLM Narrative Layer
- Structured Report
- EnterprateAI Intelligence Graph update

The EnterprateAI Intelligence Graph must remain the single source of truth. Every completed or partially completed validation must update the relevant idea, product, customer, market, pricing, cost, risk and evidence objects in the Intelligence Graph.

The LLM may:

- Interpret user-written answers.
- Classify free-text answers into structured fields.
- Explain deterministic scores.
- Summarise external research.
- Identify patterns and risks.
- Generate validation experiments.
- Suggest business-model options.
- Produce the report narrative.

The LLM must not:

- Invent market statistics.
- Invent competitor revenue or market share.
- Invent source URLs.
- independently decide the final numerical validation score.
- override deterministic calculations.
- present assumptions as verified facts.
- declare product-market fit based only on user opinions.
- describe an idea as validated merely because the idea sounds attractive.
- calculate TAM, SAM, SOM or CAGR without showing the formula and assumptions.
- provide legal, financial or investment guarantees.

Do not remove or break existing EnterprateAI modules, workspaces, authentication, subscription logic, simulations, business registration, blueprint generation or Intelligence

Graph integrations.

Before coding:

1. Inspect the existing Idea Validation frontend.
2. Inspect current API routes and AI model calls.
3. Inspect the existing validation database tables.
4. Inspect the deterministic scoring engine.
5. Inspect report-generation and PDF-export logic.
6. Inspect workspace and subscription-plan permissions.
7. Inspect the EnterprateAI Intelligence Graph schema.
8. Reuse stable components where appropriate.
9. Refactor only the components necessary for the new architecture.
10. Add versioning so old validation reports remain accessible.

NON-NEGOTIABLE OUTPUT RULE

Every material statement in a validation report must belong to one of the following evidence states:

1. VERIFIED_PRIMARY

Information retrieved and confirmed from a primary source such as an official government publication, regulator, company pricing page, company filing, audited report or official company website.

2. VERIFIED_SECONDARY

Information retrieved and confirmed from a credible secondary source.

3. SOURCE_BACKED_SINGLE

Information supported by one credible source but not independently corroborated.

4. USER_PROVIDED_UNVERIFIED

Information supplied by the user but not independently verified.

5. LLM_INFERENCE_UNVERIFIED

An inference generated by the LLM from the available information.

6. CALCULATED_FROM_VERIFIED_INPUTS

A deterministic calculation using verified source data.

7. CALCULATED_FROM_UNVERIFIED_INPUTS

A deterministic calculation using assumptions or unverified inputs.

8. NOT_AVAILABLE

Information that could not be calculated or established.

9. EXTERNAL_VERIFICATION_REQUIRED

Information that requires live external research unavailable under the current plan.

No other evidence status may be used.

A verified claim must contain:

- Claim text
- Exact metric or finding
- Source title
- Source organisation
- Direct source URL
- Publication date, where available
- Date accessed
- Geographic scope
- Relevant industry or category
- Evidence status
- Confidence level
- Short explanation of how the source supports the claim

Never create a source URL from model memory.

A URL may be shown only when it comes from:

- A successful live retrieval result;
- An approved internal source registry;
- A user-provided source;
- An existing verified database record.

If a URL is user-provided but not opened and checked, label it **USER_PROVIDED_UNVERIFIED**.

VERIFICATION STANDARD

A numerical market claim may be labelled verified when it is supported by:

- One authoritative primary source; or
- Two independent, credible secondary sources that materially agree.

Where two sources disagree:

- Display the range.
- Explain the difference in scope or methodology.
- Do not silently select the most favourable figure.
- Reduce the confidence level.

Research sources should be prioritised in this order:

1. Government and official statistical agencies
2. Regulators and public authorities
3. Company filings and official company sources
4. Recognised international institutions
5. Reputable industry bodies
6. Established market-research publishers
7. Academic research
8. Reputable business publications
9. Clearly identified industry estimates

Do not use low-quality blogs, content farms, anonymous websites or search-result snippets as authoritative evidence.

VALIDATION JOURNEY

At the beginning of the wizard, ask:

“How deeply would you like to validate your idea?”

Option A:

Basic Validation

Description:

A fast preliminary assessment of the problem, customer, proposed solution, market logic, alternatives and available evidence.

Estimated completion time:
5–7 minutes.

Option B:
Comprehensive Validation

Description:

A deeper assessment covering the market, competition, pricing, revenue model, delivery costs, fixed costs, operations, capacity, unit economics, founder readiness, regulatory exposure and validation experiments.

Estimated completion time:
15–25 minutes.

A user must be able to start with Basic Validation and upgrade to Comprehensive Validation without re-entering existing information.

Save all responses progressively.

Do not delete incomplete validations.

WIZARD DESIGN

Use a segmented, progressive wizard rather than displaying every field on one page.

Each step must contain:

- A clear title
- A short explanation
- Tooltips
- Examples adapted to the selected idea type
- “I don’t know yet” where appropriate
- AI-assisted suggestions
- Back and Continue controls
- Automatic save
- Progress indicator

- Validation of required inputs

The AI Suggest function must improve or clarify the user's answer without changing the fundamental meaning of the idea.

Do not silently replace the user's input.

Show the suggested text and allow the user to accept, edit or reject it.

STEP 1 — IDEA IDENTITY

Collect:

- Idea name
- One-sentence idea description
- Full idea description
- Idea type
- Business stage
- Customer model
- Primary industry
- Sector
- Operating country
- Initial launch country
- Initial launch city or region
- Future target geography
- Preferred currency
- Existing business or new venture
- Whether this is a new product or service for an existing business

Idea-type options must include:

- Professional service
- Local service
- Digital service
- SaaS
- Software product
- Mobile application
- Marketplace
- Platform business
- Physical product

- E-commerce
- Subscription business
- Training or education
- Event or conference
- Community or membership
- Property or real estate
- Manufacturing
- Franchise
- Social enterprise
- Nonprofit
- Internal enterprise solution
- Existing-business product extension
- Existing-business service extension
- Hybrid
- Other

Customer-model options:

- B2C
- B2B
- B2B2C
- B2G
- C2C
- Nonprofit beneficiary
- Internal organisational users
- Hybrid

Business-stage options:

- Idea only
- Customer discovery
- Prototype
- MVP
- Pilot
- Pre-revenue
- Early revenue
- Existing customers
- Scaling
- Existing business extension

STEP 2 — PROBLEM

Collect:

- What problem is being solved?
- Who experiences the problem?
- What triggers the problem?
- How frequently does it occur?
- How painful is it?
- What financial cost does it create?
- What time cost does it create?
- What emotional, operational or strategic impact does it create?
- What happens if the customer does nothing?
- Is the problem urgent or deferrable?
- Is the problem growing, stable, declining or unknown?
- Evidence that the problem exists
- Whether the problem is experienced by the buyer, user or both

Pain severity must not be captured only as “mild, moderate or severe.”

Collect:

- Frequency
- Duration
- Financial impact
- Operational impact
- Emotional impact
- Regulatory impact
- Urgency
- Current spending to solve it

STEP 3 — CUSTOMER

Collect:

- Primary customer segment
- Secondary customer segment
- Economic buyer
- End user
- Decision maker

- Influencer
- Customer location
- Customer age or company size, where relevant
- Customer industry, where relevant
- Customer job role, where relevant
- Customer behaviour
- Current spending behaviour
- Purchase frequency
- Buying triggers
- Main objections
- Channels used to reach the customer
- Ease of accessing the customer
- Initial niche or beachhead segment

Do not accept “everyone,” “all businesses,” “global users” or similarly broad descriptions as an adequate initial target customer.

Where the user provides a broad market, require the system to generate and recommend a narrower initial beachhead segment.

Clearly distinguish:

- Long-term market
- Serviceable market
- Initial launch segment
- Initial launch geography

STEP 4 — CURRENT ALTERNATIVES

Collect:

- How customers currently solve the problem
- Direct competitors
- Indirect competitors
- Substitute solutions
- Manual or DIY alternatives
- Doing nothing
- Existing spending on alternatives
- Main customer frustrations with alternatives
- Switching barriers

- Why customers may continue using existing alternatives

Competitor categories must remain separate:

- Direct competitor
- Indirect competitor
- Substitute
- DIY or manual alternative
- Status quo
- Potential future competitor

Do not state that there are “no competitors” merely because an identical product was not found.

Doing nothing is a competing alternative.

STEP 5 — PROPOSED SOLUTION

Collect:

- Solution description
- Core customer outcome
- Main features
- Main benefits
- Delivery method
- Customer journey
- Why the solution is better
- Why it is different
- Why the customer would switch
- Time to value
- Required customer behaviour change
- Trust requirements
- Adoption friction
- Dependencies
- Defensibility
- Intellectual property, data, network effects, expertise or process advantage

Separate:

- Feature
- Benefit
- Customer outcome
- Differentiator
- Defensibility

Do not treat a feature as proven differentiation unless competitors have been compared.

STEP 6 — MARKET

Basic Validation must collect:

- Initial launch geography
- Market category
- Estimated number of potential customers, if known
- Expected customer spending, if known
- Whether the market appears to be growing
- User-provided market sources
- Whether the business is local, national, regional or global

Comprehensive Validation must additionally collect:

- Market definition
- Customer population
- Addressable customer population
- Annual purchase frequency
- Average annual spend
- Geographic restrictions
- Regulatory restrictions
- Delivery restrictions
- Reachable sales channels
- Expected adoption period
- Expected initial market share
- Relevant market-growth period
- User-provided market reports or URLs

Do not confuse:

- Global market
- National market

- Serviceable market
- Initial city or region
- Future expansion market

A local or hyperlocal product must not automatically receive a global launch recommendation.

STEP 7 — REVENUE MODEL AND PRICING

Collect:

- Who pays?
- What do they pay for?
- Proposed revenue model
- Proposed price
- Payment frequency
- Free plan or trial
- Commission or transaction fee
- Advertising or sponsorship revenue
- Usage-based revenue
- Subscription revenue
- Product sales
- Service fees
- Licensing
- Marketplace take rate
- Membership
- Donations, grants or public funding
- Customer expected lifetime
- Expected repeat purchase rate
- Expected average revenue per customer

The system must recommend suitable revenue models based on:

- Idea type
- Customer behaviour
- Comparable market models
- Delivery economics
- Customer value
- Buying frequency
- Competitive pricing

- Operational complexity
- Scalability

The system must provide:

- Recommended primary revenue model
- Optional secondary revenue models
- Why each model may work
- Risks of each model
- Suitable value metric
- Indicative launch price or price range
- Low, base and high pricing scenarios
- Evidence basis
- Verification status

Observed competitor pricing must remain separate from EnterprateAI's recommended pricing.

Do not compare commercially different products as though they offer equivalent subscriptions.

Separate competitor pricing into:

- Consumer subscription
- Business subscription
- Organiser subscription
- Transaction fee
- Advertising
- Premium listing
- Licensing
- One-off purchase
- Service fee
- Enterprise contract
- Donation or grant funding

STEP 8 — DELIVERY COSTS, FIXED COSTS AND UNIT ECONOMICS

This step is mandatory for Comprehensive Validation.

Collect user-known costs and allow “I don’t know yet.”

Variable or delivery costs may include:

- Labour per delivery
- Contractor cost
- Materials
- Inventory
- Packaging
- Delivery
- Payment-processing fees
- Platform usage fees
- Cloud and AI usage
- Customer support
- Returns and refunds
- Sales commissions
- Marketplace payouts
- Event catering
- Venue cost per attendee
- Trainer or speaker cost
- Maintenance
- Insurance per transaction
- Verification costs
- Third-party licensing

Fixed costs may include:

- Salaries
- Office or premises
- Software subscriptions
- Hosting baseline
- Marketing retainers
- Insurance
- Professional fees
- Regulatory fees
- Equipment
- Administration
- Warehouse
- Rent
- Development

- Customer-support infrastructure

The research and recommendation engine must suggest possible cost categories appropriate to the selected idea type.

Suggested costs must include:

- Cost description
- Low estimate
- Base estimate
- High estimate
- Unit
- Time period
- Research basis
- Evidence status
- Source URL where verified
- Explanation
- Whether the user has accepted or replaced the estimate

Never present suggested costs as actual business costs.

Label them:

“Indicative cost assumption — confirm with suppliers.”

Calculate only when sufficient inputs exist:

- Gross profit
- Gross margin
- Contribution margin
- Break-even volume
- Break-even revenue
- Monthly fixed cost
- Variable cost per unit
- Revenue per unit
- Customer acquisition payback
- Estimated runway
- Capacity utilisation
- Operating leverage

Every calculation must display:

- Formula
- Inputs
- Units
- Source status
- Result
- Sensitivity range

STEP 9 — CAPACITY AND OPERATIONAL REQUIREMENTS

Collect or estimate:

- Delivery unit
- Maximum units or customers served per day, week or month
- Time required per delivery
- Number of staff required
- Required staff skills
- Supplier dependencies
- Technology dependencies
- Facilities
- Equipment
- Inventory
- Working capital
- Quality controls
- Customer support
- Fulfilment
- Onboarding
- Verification
- Compliance
- Key operating bottleneck
- Lead time
- Geographic limitations
- Scalability constraints

The system must recommend likely operational requirements based on the idea category and research evidence.

Separate:

- Launch requirements
- Steady-state requirements
- Scale-up requirements

Where capacity cannot be calculated, display:

“Capacity not calculated — operating-time and resource inputs are incomplete.”

STEP 10 — TRACTION AND EVIDENCE

Collect structured evidence.

Evidence options must include:

- No evidence yet
- Personal experience
- Informal conversations
- Customer interviews
- Survey responses
- Social-media engagement
- Search demand
- Landing-page visits
- Email sign-ups
- Waiting list
- Letters of intent
- Requests for quotation
- Pre-orders
- Deposits
- Paid pilots
- Existing customers
- Repeat customers
- Revenue
- Referrals
- Partnerships
- Contracts
- Usage data
- Retention data
- Churn data

For each evidence item collect:

- Evidence type
- Quantity
- Date
- Customer segment
- Geography
- Collection method
- Supporting document or URL
- Whether payment was involved
- Whether the evidence represents stated or observed behaviour
- Verification status

Evidence quality must distinguish between:

- Stated interest
- Demonstrated intent
- Financial commitment
- Actual usage
- Repeat behaviour

Do not treat likes, impressions or survey interest as equivalent to paid demand.

STEP 11 — FOUNDER AND EXECUTION READINESS

Comprehensive Validation must collect:

- Founder industry experience
- Founder functional experience
- Technical capability
- Sales capability
- Operational capability
- Available time
- Available capital
- Existing audience
- Existing partnerships
- Existing suppliers
- Existing technology
- Existing intellectual property
- Team members

- Skills gaps
- Funding needs
- Launch deadline
- Dependencies outside the founder's control

Founder readiness must be scored separately from market attractiveness.

A strong market with a weak current team should not be described as a weak idea. It should be described as an execution-capability gap.

STEP 12 — REGULATORY, TRUST AND DELIVERY RISK

Collect category-appropriate risks, including:

- Data protection
- Consumer protection
- Financial regulation
- Medical regulation
- Employment regulation
- Planning permission
- Property regulation
- Food safety
- Product safety
- Child safeguarding
- Professional licensing
- Insurance
- Payments
- Intellectual property
- Platform moderation
- Trust and safety
- Fraud
- Supplier concentration
- Key-person dependency
- Reputation
- Environmental obligations

Do not provide definitive legal conclusions.

Use:

“Potential regulatory consideration — professional verification required.”

IDEA-TYPE CONDITIONAL LOGIC

Display category-specific fields only when relevant.

PROFESSIONAL OR LOCAL SERVICE

Collect:

- Billable hours
- Delivery time per job
- Staff utilisation
- Travel time
- Service area
- Contractor requirement
- Average job value
- Repeat-service frequency
- Scheduling capacity
- Payment terms
- Quality assurance
- Client concentration

Relevant simulations:

- Client loss
- Staff utilisation
- Price increase
- Payment delay
- Capacity expansion
- Contractor-cost increase

SAAS OR SOFTWARE

Collect:

- Target users
- Seats or accounts
- Monthly or annual pricing

- Free-to-paid conversion
- Customer acquisition cost
- Churn
- Retention
- Cloud cost
- AI usage cost
- Support cost
- Development cost
- Sales cycle
- Implementation effort
- Integrations
- Security requirements

Relevant simulations:

- Churn increase
- Low conversion
- CAC increase
- Cloud-cost increase
- Pricing change
- Enterprise-sales delay

MOBILE APPLICATION

Collect:

- Platform
- User acquisition channel
- Active-user target
- Engagement frequency
- Retention target
- Monetisation model
- Store fees
- Moderation
- Location dependency
- Network effects
- Privacy
- Trust and safety

Relevant simulations:

- Low retention
- User-density failure
- Store-fee increase
- Moderation cost
- Freemium conversion
- Acquisition-cost increase

MARKETPLACE OR PLATFORM

Collect:

- Supply side
- Demand side
- Economic buyer
- Transaction type
- Average transaction value
- Take rate
- Supply acquisition
- Demand acquisition
- Liquidity threshold
- Geographic density
- Disintermediation risk
- Payment flow
- Escrow
- Verification
- Trust and safety
- Disputes
- Refunds
- Network effects

Relevant simulations:

- Supply shortage
- Demand shortage
- Low transaction density
- Take-rate reduction
- Disintermediation
- Fraud incident
- Provider failure

- Geographic expansion

PHYSICAL PRODUCT OR E-COMMERCE

Collect:

- Product cost
- Supplier
- Minimum order quantity
- Inventory
- Packaging
- Delivery
- Returns
- Defects
- Storage
- Lead time
- Gross margin
- Sales channels
- Marketplace fees
- Working capital
- Reorder cycle

Relevant simulations:

- Supplier-price increase
- Delivery-cost increase
- Return-rate increase
- Slow inventory
- Demand spike
- Stock-out
- Marketplace-fee increase

TRAINING OR EDUCATION

Collect:

- Course type
- Delivery format
- Cohort size
- Trainer cost

- Course duration
- Platform
- Certification
- Completion rate
- Customer outcome
- Repeat courses
- Corporate or individual buyer
- Support requirements

Relevant simulations:

- Low enrolment
- Cohort-size change
- Trainer-cost increase
- Price discount
- Completion-rate decline
- Corporate contract delay

EVENT OR CONFERENCE

Collect:

- Event format
- Venue capacity
- Expected delegates
- Ticket categories
- Ticket prices
- Venue cost
- Catering cost
- AV cost
- Speaker cost
- Marketing cost
- Sponsorship
- Exhibitor income
- Refund risk
- Break-even attendance
- Booking deadline

Relevant simulations:

- Low attendance
- Venue-cost increase
- Sponsorship failure
- Ticket-price change
- Catering-cost increase
- Event cancellation

PROPERTY OR REAL ESTATE

Collect:

- Property type
- Location
- Purchase or lease model
- Deposit
- Finance
- Rent
- Occupancy
- Maintenance
- Management fees
- Regulation
- Insurance
- Void periods
- Yield
- Capital expenditure

Relevant simulations:

- Occupancy decline
- Interest-rate increase
- Maintenance shock
- Rent reduction
- Void period
- Regulatory cost

MANUFACTURING

Collect:

- Production capacity

- Equipment
- Factory cost
- Raw materials
- Labour
- Yield
- Scrap
- Quality
- Batch size
- Lead time
- Supplier concentration
- Distribution
- Working capital
- Compliance

Relevant simulations:

- Material-cost increase
- Production downtime
- Yield decline
- Supplier failure
- Demand spike
- Capacity expansion

NONPROFIT OR SOCIAL ENTERPRISE

Collect:

- Beneficiary
- Funder
- Donor
- Grant dependency
- Impact objective
- Cost per beneficiary
- Funding cycle
- Volunteer dependency
- Earned revenue
- Reporting requirements
- Impact measurement
- Sustainability

Relevant simulations:

- Grant loss
- Donation decline
- Cost-per-beneficiary increase
- Volunteer shortage
- Contract delay
- Earned-income growth

FRANCHISE

Collect:

- Franchise fee
- Royalty
- Territory
- Brand support
- Required capital
- Operating standards
- Location
- Break-even period
- Supplier restrictions
- Franchisee obligations
- Local demand

Relevant simulations:

- Revenue underperformance
- Royalty increase
- Location delay
- Labour-cost increase
- Territory saturation

MARKET RESEARCH ENGINE

The market-research engine must create a structured research plan before generating a report.

The research plan must identify:

- Idea type
- Customer segment
- Launch geography
- Market definition
- Required data points
- Preferred sources
- Search queries
- Recency requirement
- Verification threshold

For paid-plan research, investigate:

- Market size
- Market growth
- Customer population
- Customer spending
- Industry trends
- Search demand where available
- Direct competitors
- Indirect competitors
- Competitor pricing
- Competitor positioning
- Common revenue models
- Delivery-cost benchmarks
- Fixed-cost benchmarks
- Capacity benchmarks
- Regulatory considerations
- Customer behaviour
- Market barriers

Every research claim must be stored as a separate claim object.

Example claim object:

```
{  
  "claim_id": "claim_uuid",  
  "claim": "The UK market was valued at £X in 2025.",  
  "metric_name": "market_value",  
  "value": null,  
}
```

```
"currency": "GBP",  
"period": "2025",  
"geography": "United Kingdom",  
"segment": "defined market segment",  
"source_title": null,  
"source_organisation": null,  
"source_url": null,  
"publication_date": null,  
"accessed_at": null,  
"evidence_status": "NOT_AVAILABLE",  
"confidence": 0,  
"methodology_notes": null  
}
```

FREE-PLAN RESEARCH RULE

When external retrieval is unavailable:

- The LLM may provide market context and indicative assumptions.
- It must state that the research is not live verified.
- It must not present model memory as current research.
- It must not invent report titles, publication dates or URLs.
- It must not use the word “verified.”
- It must not use exact competitor revenue or market-share figures unless supplied by the user.
- It must not present an exact CAGR unless the underlying figures are available.
- It must provide a list of facts that require paid external verification.
- It may recommend authoritative source categories the user should consult.
- Any numerical assumption must be editable by the user.

Use the label:

“Indicative LLM estimate — not live verified. Confirm through authoritative market research before making an investment decision.”

TAM, SAM AND SOM ENGINE

Do not calculate market size from vague statements such as “the global adult population interested in the product.”

Use explicit formulas.

BOTTOM-UP TAM

TAM =

Total eligible customers

× average annual purchase frequency

× average revenue per purchase

or

TAM =

Total eligible accounts

× average annual revenue per account

BOTTOM-UP SAM

SAM =

Customers within the serviceable geography

× segment eligibility percentage

× channel reachability percentage

× average annual revenue per customer

Only apply percentages when there is evidence or a clearly labelled assumption.

BOTTOM-UP SOM

SOM =

Maximum realistically acquirable customers during the defined period

× expected annual revenue per customer

SOM must consider:

- Founder resources
- Marketing budget
- Sales capacity
- Delivery capacity
- Geographic coverage
- Competitor strength

- Sales cycle
- Market-entry period

Do not calculate SOM by selecting an arbitrary percentage of SAM.

TOP-DOWN METHOD

A top-down method may be used when a credible market report defines a sufficiently similar market.

Display:

- Original market definition
- Original market size
- Geographic scope
- Segment adjustments
- Adjustment assumptions
- Final result
- Sources

Where possible, show both:

- Top-down market estimate
- Bottom-up market estimate

Explain why they differ.

CAGR FORMULA

Future Market Value =
Current Market Value $\times (1 + \text{CAGR})^{\text{Number of Years}}$

Where the start and end values are known:

CAGR =
 $(\text{Ending Value} \div \text{Starting Value})^{(1 \div \text{Number of Years})} - 1$

The engine must run a mathematical integrity check.

A report must not show a future market value that contradicts the stated current value, CAGR and number of years.

Currency conversions must include:

- Original currency
- Converted currency
- Exchange rate
- Exchange-rate date
- Exchange-rate source

Without this information, retain the original currency.

MARKET-SIZING DISPLAY

Every TAM, SAM or SOM result must show:

- Result
- Low case
- Base case
- High case
- Method
- Formula
- Assumptions
- Sources
- Verification status
- Confidence
- Limitations

Where inputs are insufficient, display:

“Not calculated — insufficient evidence.”

COMPETITOR INTELLIGENCE

For every competitor collect:

- Name
- Website

- Competitor category
- Target customer
- Geography
- Core proposition
- Revenue model
- Pricing model
- Current price
- Price date
- Strengths
- Weaknesses
- Market positioning
- Evidence status
- Source URL
- Last verified date

Do not provide estimated competitor revenue or market share unless verified.

Do not mix market share by:

- Revenue
- Customers
- Downloads
- Website traffic
- Transactions

The metric must be clearly stated.

Where competitor revenue or market share is not publicly available, display:

“Not publicly verified.”

COMPETITION CLASSIFICATION

Market saturation and competitive intensity must be calculated separately.

For example:

- Market saturation: number and maturity of available alternatives.
- Competitive intensity: strength of competition for the specific launch segment.

- Differentiation opportunity: unmet needs not well served by alternatives.

This avoids contradictory output such as:

“Medium saturation,” “low competition” and “no competitors found”

without explanation.

PRICING RECOMMENDATION ENGINE

The pricing recommendation must analyse:

- Competitor prices
- Customer value
- Current customer spending
- Willingness-to-pay evidence
- Cost to deliver
- Gross-margin requirement
- Pricing model
- Purchase frequency
- Idea stage
- Market position
- Customer segment

Output:

- Observed competitor price range
- Recommended launch price range
- Low-price scenario
- Base-price scenario
- Premium-price scenario
- Recommended value metric
- Primary revenue model
- Secondary revenue opportunities
- Estimated gross margin where inputs permit
- Price-validation experiment
- Evidence status
- Sources

Do not recommend a precise price solely because competitors charge a similar amount.

Where willingness-to-pay evidence is absent, state:

“Recommended price is a test hypothesis, not a validated customer price.”

COST AND CAPACITY RESEARCH

The research engine must identify likely:

- Delivery costs
- Variable costs
- Fixed costs
- Startup costs
- Staffing requirements
- Technology requirements
- Supplier requirements
- Regulatory costs
- Insurance requirements
- Capacity constraints
- Operating bottlenecks

Every suggested amount must be:

- Sourced and verified;
- User-provided;
- Or clearly labelled as an unverified assumption.

Use low, base and high scenarios rather than false precision.

DETERMINISTIC SCORING ENGINE

Produce two independent scores:

1. Validation Potential Score
2. Evidence Confidence Score

Do not combine these into one misleading score.

VALIDATION POTENTIAL SCORE WEIGHTS

- Problem strength: 10
- Customer clarity and accessibility: 8
- Evidence and traction: 15
- Solution relevance: 8
- Differentiation and defensibility: 7
- Demand and market attractiveness: 12
- Competition and positioning: 7
- Revenue and pricing viability: 8
- Unit economics and financial feasibility: 8
- Operational feasibility and capacity: 6
- Founder and execution readiness: 6
- Regulatory and execution risk: 5

Total:
100

Each dimension must be generated from deterministic scoring rules stored in a configurable scoring table.

The LLM must not select the score.

The LLM may classify a user's answer into structured attributes, but the confidence of that classification must be recorded.

Where an important free-text classification has low confidence, ask the user to confirm the interpretation before final scoring.

EVIDENCE CONFIDENCE SCORE

Calculate separately using:

- Input completeness: 20
- Primary customer evidence: 25
- Behavioural or transaction evidence: 25
- External market evidence: 20
- Source quality and recency: 10

Total:
100

Evidence strength should increase approximately through the following hierarchy:

- No evidence
- Founder assumption
- Personal anecdote
- Informal conversation
- Social engagement
- Survey response
- Structured customer interview
- Waiting list
- Letter of intent
- Request for quotation
- Pre-order
- Deposit
- Paid pilot
- Paid customer
- Repeat purchase
- Measured retention
- Profitable repeatable demand

The exact scoring table must be configurable and versioned.

VERDICT ENGINE

Use both Potential Score and Evidence Confidence.

Do not display “Accepted” or “Rejected” as the primary verdict.

Use evidence-sensitive verdicts.

Recommended verdict categories:

1. Weak Hypothesis
Low potential and low supporting evidence.
2. Needs Reframing

The problem, customer or solution is unclear.

3. Developing Fit

Some commercial logic exists, but important weaknesses remain.

4. Promising but Unvalidated

The idea appears commercially plausible, but evidence is insufficient.

5. Evidence-Supported Opportunity

Strong potential with credible supporting evidence.

6. Early Market Validation

Meaningful behavioural or financial evidence exists.

7. Ready for Controlled Pilot

The idea has sufficient evidence and operational readiness for a limited pilot.

8. Ready for Scale Assessment

Repeatable demand exists, but scaling economics and operational resilience require assessment.

The engine must not declare “product-market fit” without strong retention, repeat usage, repeat purchase or equivalent behavioural evidence.

Example verdict rules:

- Potential below 40:

Weak Hypothesis or Needs Reframing

- Potential 40–59:

Developing Fit

- Potential 60–74 with confidence below 50:

Promising but Unvalidated

- Potential 60–74 with confidence 50 or above:

Evidence-Supported Opportunity

- Potential 75 or above with confidence below 50:

Strong Hypothesis, Insufficient Evidence

- Potential 75 or above with confidence 50–69:
Ready for Controlled Pilot
- Potential 75 or above with confidence 70 or above:
Early Market Validation or Ready for Scale Assessment, depending on the evidence type

These thresholds must remain configurable.

CONTRADICTION AND INTEGRITY ENGINE

Before presenting the report, run automated checks for:

- “No competitors” while competitors are listed
- “Demand unknown” while claiming positive demand
- “Global launch” for a hyperlocal network product
- TAM lower than SAM
- SAM lower than SOM
- Future market value inconsistent with CAGR
- Price recommendations inconsistent with delivery cost
- Positive unit economics where variable cost exceeds revenue
- High confidence with no customer evidence
- Market validation based only on founder opinion
- Competitor pricing from incomparable products
- Exact survival rates without sources
- Verified status without a retrievable URL
- Current market claims based on stale sources
- Local idea sized only using global population
- High scalability claim despite manual capacity constraints
- High differentiation claim without competitor comparison
- Strong willingness-to-pay claim without financial evidence
- High operational readiness with no delivery model
- High founder readiness without time, funding or capability information

Where a contradiction is detected:

- Correct the report where possible.
- Reduce confidence.

- Display the limitation.
- Never silently ignore the contradiction.

VALIDATION EXPERIMENT ENGINE

Generate up to five prioritised experiments.

Each experiment must contain:

- Hypothesis
- Why it matters
- Target customer
- Method
- Sample size
- Duration
- Budget
- Metric
- Pass threshold
- Partial-pass threshold
- Fail threshold
- Evidence to collect
- What to do if passed
- What to do if failed

Experiments must be appropriate to the idea type and stage.

Examples include:

- Customer interviews
- Problem-ranking survey
- Landing-page test
- Waitlist test
- Pricing test
- Pre-order
- Deposit
- Letter of intent
- Paid discovery
- Concierge MVP
- Manual service pilot
- Prototype usability test

- Marketplace supply recruitment
- Marketplace demand recruitment
- Event ticket reservation
- Sponsor letter of intent
- Product sample order
- Supplier quotation
- Corporate pilot
- Retention test

Avoid vague recommendations such as:

“Conduct market research.”

Use measurable recommendations such as:

“Interview 20 procurement managers in UK manufacturing businesses within 14 days. Pass if at least 12 describe the problem as frequent, 8 request a demonstration and 3 agree to a paid or formally documented pilot.”

RECOMMENDED SIMULATION ENGINE

Simulations must be selected according to:

- Idea type
- Business stage
- Revenue model
- Key risks
- Cost structure
- Evidence gaps

Do not recommend generic simulations that do not match the business model.

Every simulation recommendation must explain:

- Why it is relevant
- Inputs required
- Decision it helps the user make

REPORT STRUCTURE

Replace the current report structure with the following:

1. Idea Overview
2. Validation Verdict
3. Validation Potential Score
4. Evidence Confidence Score
5. Evidence Quality Summary
6. Key Assumptions
7. Problem Validation
8. Customer Validation
9. Solution Validation
10. Demand Validation
11. Market Attractiveness
12. TAM, SAM and SOM
13. Competitive Landscape
14. Differentiation and Positioning
15. Pricing and Revenue Model
16. Delivery Costs and Fixed Costs
17. Unit Economics
18. Capacity and Operational Requirements
19. Founder and Execution Readiness
20. Regulatory, Trust and Delivery Risks
21. Critical Contradictions
22. Validation Experiments
23. Recommended Simulations
24. 30-, 60- and 90-Day Validation Roadmap
25. Final Decision Gate
26. Sources and Methodology
27. Data Limitations
28. Disclaimer

BASIC VALIDATION REPORT

Basic Validation may provide:

- Idea overview
- Preliminary verdict
- Potential score
- Evidence-confidence score

- Problem assessment
- Customer assessment
- Solution assessment
- Alternatives
- Initial market logic
- Key risks
- Evidence gaps
- Three validation experiments
- Next decision gate

Do not include hard financial projections when the necessary inputs do not exist.

COMPREHENSIVE VALIDATION REPORT

Comprehensive Validation should provide all report sections where data is available.

Do not display empty sections.

Where a section cannot be completed, display the reason and required inputs.

REPORT TITLE

Never use a truncated user response such as:

“I want to start an”

as the report title.

Generate a clear idea title and allow the user to edit it before running the validation.

Example:

“Real-Time Local Interest-Based Social Connection Platform”

MARKET HEALTH SIGNALS

Every signal must show:

- Signal name

- Finding
- Evidence
- Source
- Date
- Geography
- Verification status
- Confidence

Where demand data is unavailable, display:

“Demand signal unavailable.”

Do not replace missing evidence with a positive or negative assumption.

SOURCE DISPLAY

Place source markers beside every material claim.

Create a dedicated Sources and Methodology section containing:

- Source number
- Source title
- Organisation
- URL
- Publication date
- Access date
- Claim supported
- Verification status

URLs must be clickable in the web report and PDF.

USER INTERFACE REQUIREMENTS

The report interface must:

- Clearly distinguish Potential Score from Evidence Confidence.
- Display evidence badges.
- Display verified and unverified claims differently.
- Allow calculations to expand under “How this was calculated.”

- Allow assumptions to be edited.
- Recalculate immediately after an input changes.
- Show the scoring-engine version.
- Show the report-generation date.
- Show research access date.
- Avoid overlapping chat buttons.
- Avoid truncated table values.
- Remain readable on mobile.
- Generate a clean PDF.
- Avoid blank page-break areas.
- Keep tables within page width.
- Repeat table headers across PDF pages.
- Include clickable sources.
- Include a visible disclaimer.
- Prevent “Beta” interface elements from appearing inside exported reports unless intentionally required.

STRUCTURED OUTPUT CONTRACT

All validation results must be stored in a structured output object.

Minimum structure:

```
{
  "meta": {
    "validation_id": "",
    "workspace_id": "",
    "user_id": "",
    "engine_version": "2.0",
    "scoring_version": "",
    "prompt_version": "",
    "validation_mode": "basic_or_comprehensive",
    "subscription_plan": "free_or_paid",
    "created_at": "",
    "research_accessed_at": null,
    "currency": "",
    "operating_country": "",
    "launch_geography": ""
  },
  "idea_profile": {},
}
```

```
"customer_profile": {},
"problem_profile": {},
"solution_profile": {},
"business_model": {},
"evidence": [],
"research_claims": [],
"market_sizing": {
  "tam": null,
  "sam": null,
  "som": null,
  "methodology": [],
  "assumptions": [],
  "integrity_check": ""
},
"competitors": [],
"pricing": {},
"costs": {},
"unit_economics": {},
"capacity": {},
"operations": {},
"scores": {
  "potential_score": 0,
  "evidence_confidence_score": 0,
  "dimensions": []
},
"verdict": {},
"risk_flags": [],
"contradictions": [],
"experiments": [],
"recommended_simulations": [],
"roadmap": {},
"sources": [],
"limitations": [],
"trace": {
  "calculation_inputs": [],
  "calculation_outputs": [],
  "score_rules_applied": [],
  "llm_inferences": []
}
}
```

Every score and calculation must be traceable.

Every LLM-generated inference must appear in the trace object.

INTELLIGENCE GRAPH UPDATE

After validation, update or create:

- Idea entity
- Product or service entity
- Customer segment
- Problem entity
- Solution entity
- Market entity
- Geography entity
- Competitor entity
- Pricing hypothesis
- Revenue-model hypothesis
- Cost assumptions
- Capacity assumptions
- Evidence items
- Risk items
- Validation experiments
- Validation status
- Confidence level

Do not overwrite confirmed user data with an LLM assumption.

Use:

- User-confirmed
- System-calculated
- Externally verified
- LLM-inferred
- Superseded

as data-provenance states.

PLAN UPGRADE BEHAVIOUR

For free-plan users:

- Allow Basic or Comprehensive input journeys according to product policy.
- Show indicative analysis.
- Mark live external market verification as unavailable.
- Clearly identify which findings could be strengthened by paid research.
- Do not deliberately degrade deterministic calculations based on user inputs.
- Do not provide fake citations to make the free report appear complete.

For paid-plan users:

- Run the external research workflow.
- Verify market and competitor claims.
- Recalculate the report using sourced evidence.
- Show what changed between the free and paid report.
- Preserve the user's original assumptions for comparison.

QUALITY-ASSURANCE TESTS

Before release, create automated and manual tests covering at least:

1. SaaS idea with no evidence
2. SaaS idea with paid customers
3. Local professional service
4. Marketplace with two-sided users
5. Hyperlocal mobile application
6. Physical e-commerce product
7. Manufacturing idea
8. Training course
9. Paid event
10. Free community event
11. Property idea
12. Nonprofit
13. Franchise
14. Existing-business service extension
15. Global idea with a local launch market
16. Idea with no competitor data
17. Idea with conflicting competitor data

18. Idea with incomplete costs
19. Idea with negative unit economics
20. Idea with user-provided URLs
21. Free-plan LLM-only report
22. Paid-plan verified report
23. Market calculation using CAGR
24. Multiple currencies
25. Source disagreement
26. Stale research data
27. Broad target customer
28. No customer interviews
29. Pre-order evidence
30. Repeat-customer evidence

Acceptance criteria:

- Identical structured inputs produce identical deterministic scores.
- Free-plan reports never label LLM knowledge as verified.
- No source URL is invented.
- TAM is never lower than SAM.
- SAM is never lower than SOM.
- CAGR calculations reconcile.
- Competitor classifications are consistent.
- Pricing comparisons use equivalent business models.
- Missing data is clearly disclosed.
- Score narrative matches the calculated score.
- Evidence confidence reflects evidence quality.
- Report verdict reflects both scores.
- Category-specific simulations are recommended.
- Calculations expose formulas and assumptions.
- User edits trigger recalculation.
- Every report has a complete title.
- Every verified claim has a clickable source.
- PDF exports contain no truncated text or overlapping interface elements.
- No report claims product-market fit without behavioural evidence.
- The Intelligence Graph is updated successfully.
- Existing EnterprateAI workflows remain functional.

DELIVERY REQUIREMENTS

Provide:

1. Updated database schema
2. Database migration
3. Wizard UI
4. Basic and Comprehensive journeys
5. Category-conditional form engine
6. Plan-based research permissions
7. Evidence model
8. Research claim model
9. Deterministic scoring engine
10. Evidence-confidence engine
11. Market-sizing calculator
12. Pricing recommendation engine
13. Cost and capacity recommendation engine
14. Contradiction engine
15. Experiment generator
16. Simulation recommender
17. Report API
18. Web report
19. PDF report
20. Intelligence Graph integration
21. Automated tests
22. Audit logs
23. Technical documentation
24. Administrator documentation for changing weights, thresholds and source rules

Do not hardcode scoring weights, category questions, verdict thresholds or evidence values directly in presentation components.

Store them in configurable, version-controlled backend configuration.

FINAL IMPLEMENTATION STANDARD

The completed module must produce a report that is:

- Evidence-aware
- Mathematically consistent
- Source-transparent
- Category-specific

- Commercially useful
- Honest about uncertainty
- Actionable
- Reproducible
- Traceable
- Suitable for controlled business decision support

The product must prefer:

“Insufficient evidence”

over an unsupported conclusion.

The product must prefer:

“Not calculated”

over a fabricated number.

The product must prefer:

“LLM-generated — not live verified”

over pretending that model knowledge is current market research.

2. Production Runtime System Prompt

This is the prompt the backend should use when asking the LLM to analyse a validation. It assumes that calculations and scores have already been produced by the deterministic backend.

ENTERPRATEAI IDEA VALIDATION RUNTIME SYSTEM PROMPT

You are the narrative and analytical interpretation layer of the EnterprateAI Idea Validation Engine.

Your role is to interpret structured user inputs, research evidence, deterministic calculations, validation scores and system-detected risks.

You do not independently determine the final numerical validation score.

You do not override backend calculations.

You must produce a credible, evidence-aware, commercially useful idea-validation analysis.

INPUTS YOU WILL RECEIVE

You may receive:

- Validation mode
- Subscription plan
- Idea profile
- Idea type
- Business stage
- Customer model
- Problem profile
- Customer profile
- Solution profile
- Current alternatives
- Revenue model
- Pricing assumptions
- Delivery-cost assumptions
- Fixed-cost assumptions
- Capacity assumptions
- Operational requirements
- Founder capability
- Traction evidence
- External research claims
- Market-sizing calculations
- Competitor records
- Deterministic scores
- Evidence-confidence score
- Risk flags
- Contradiction flags
- Recommended simulations
- Calculation trace
- Source records

CORE RULES

1. Never invent facts, figures, competitors, prices, market sizes, growth rates, revenue, market share, source titles or URLs.

2. Never describe an external claim as verified unless its evidence status is:

- VERIFIED_PRIMARY
- VERIFIED_SECONDARY
- SOURCE_BACKED_SINGLE
- CALCULATED_FROM_VERIFIED_INPUTS

3. SOURCE_BACKED_SINGLE must be described as source-backed but not independently corroborated.

4. User-provided information must be described as user-provided unless independently verified.

5. LLM-generated assumptions must always be labelled:

“LLM-generated assumption — not live verified.”

6. Under the free plan, do not imply that internal model knowledge is current live market research.

7. Under the free plan, use:

“This finding is indicative and has not been verified through live external research.”

8. Do not create or guess a URL.

9. Where a source URL is unavailable, use null in structured output and state:

“Source URL unavailable — external verification required.”

10. Do not calculate missing numbers.

11. Where data is insufficient, state:

- “Not calculated”
- “Insufficient evidence”
- “External verification required”

12. Do not use false precision.

13. Prefer ranges when assumptions are uncertain.

14. Clearly separate:

- User input
- Verified research
- Unverified research
- Deterministic calculation
- LLM inference

15. Explain the basis of every material recommendation.

16. Do not claim that the idea is validated merely because the solution appears attractive.

17. Do not claim product-market fit without behavioural evidence such as repeat use, repeat purchases, retention or comparable evidence.

18. Do not describe likes, impressions, survey interest or informal conversations as proven willingness to pay.

19. Do not state that there are no competitors when substitutes, manual alternatives or the status quo exist.

20. Do not recommend a global launch for a local, hyperlocal or network-density-dependent business unless the supplied evidence supports it.

21. Do not recommend a precise price without explaining the pricing basis.

22. Do not compare different pricing models as though they are equivalent.

23. Do not present suggested costs as actual supplier quotations.

24. Do not provide definitive legal, regulatory, tax or investment advice.

25. Do not contradict deterministic scores or calculations.

PLAN-SPECIFIC BEHAVIOUR

FREE PLAN

When subscription_plan = free:

- Treat external market statements as indicative.
- Label all LLM-generated market information as unverified.
- Do not describe market data as live.
- Do not invent citations.
- Do not invent competitor revenue or market share.
- Identify facts that need external verification.
- Explain how verification could affect the conclusion.
- Use user-provided inputs and deterministic calculations where available.

PAID PLAN

When subscription_plan = paid:

- Use the supplied research claims and source records.
- Cite every material market, competitor, pricing and growth claim.
- Distinguish primary from secondary evidence.
- Mention source disagreement.
- Mention stale or geographically mismatched evidence.
- Do not use a source outside the scope it supports.

VALIDATION MODE

When validation_mode = basic:

Prioritise:

- Problem
- Customer

- Solution
- Alternatives
- Initial market logic
- Evidence
- Risks
- Validation experiments
- Next action

Do not pretend to provide comprehensive unit economics where detailed financial inputs are absent.

When validation_mode = comprehensive:

Analyse:

- Problem
- Customer
- Solution
- Demand
- Market
- Competition
- Differentiation
- Pricing
- Revenue model
- Delivery costs
- Fixed costs
- Unit economics
- Capacity
- Operations
- Founder readiness
- Regulatory and delivery risks
- Evidence
- Validation experiments
- Simulations
- Decision gate

EVIDENCE INTERPRETATION

Use the following distinction:

Stated evidence:

- Opinions
- Conversations
- Surveys
- Expressions of interest

Intent evidence:

- Waiting-list registration
- Letter of intent
- Request for quotation
- Demo request
- Appointment booking

Financial evidence:

- Pre-order
- Deposit
- Paid pilot
- Paid customer

Behavioural evidence:

- Actual usage
- Repeat usage
- Repeat purchase
- Retention
- Referral
- Low churn

Do not describe stated evidence as financial or behavioural validation.

MARKET-SIZING INTERPRETATION

Only discuss TAM, SAM or SOM when the calculation object contains sufficient inputs.

For every available market-size figure explain:

- Definition
- Geography
- Customer segment
- Formula
- Assumptions

- Verification status
- Confidence
- Limitation

Check:

- TAM $\geq$ SAM
- SAM $\geq$ SOM
- CAGR and future value reconcile
- Currency and period are consistent

Where the integrity status indicates failure, do not repeat the invalid number as a conclusion.

State that the calculation requires correction.

COMPETITOR INTERPRETATION

Separate:

- Direct competitors
- Indirect competitors
- Substitutes
- DIY alternatives
- Status quo

Do not describe the market as having no competition merely because no identical product exists.

Competitor revenue, market share and price must be included only when supplied with an appropriate evidence status.

PRICING INTERPRETATION

Separate:

1. Observed market pricing
2. User-proposed pricing
3. EnterprateAI recommended test pricing

Describe recommended pricing as a hypothesis unless willingness-to-pay evidence exists.

When appropriate, recommend:

- Low-price test
- Base-price test
- Premium-price test
- Suitable value metric
- Primary revenue model
- Secondary revenue model
- Price-validation experiment

Explain the relationship between:

- Price
- Customer value
- Cost to deliver
- Gross margin
- Competitor positioning
- Customer segment

COST INTERPRETATION

Separate:

- User-confirmed costs
- Verified benchmark costs
- Unverified assumptions
- Calculated costs

Use:

“Indicative cost assumption — confirm with suppliers”

for unverified cost recommendations.

CAPACITY INTERPRETATION

Explain:

- Unit of delivery
- Maximum capacity
- Required resources
- Bottlenecks
- Scalability limitations
- Capacity utilisation
- Conditions required to scale

Where capacity data is incomplete, do not estimate an exact maximum capacity.

VERDICT INTERPRETATION

Use the deterministic:

- Validation Potential Score
- Evidence Confidence Score
- Verdict category

Do not create another overall score.

Explain:

- Why the idea received the potential score
- Why the evidence-confidence score is high or low
- The strongest dimension
- The weakest dimension
- The main evidence gap
- The principal decision required

A high Potential Score and low Evidence Confidence means:

“The idea is a promising hypothesis, not a validated opportunity.”

A moderate Potential Score and high Evidence Confidence means:

“The evidence is credible, but the commercial proposition requires improvement.”

A high Potential Score and high Evidence Confidence may support:

“Ready for a controlled pilot”

or a more advanced stage where the evidence genuinely supports it.

VALIDATION EXPERIMENTS

Generate practical, measurable experiments.

Every experiment must contain:

- Hypothesis
- Target segment
- Method
- Sample
- Duration
- Budget
- Pass threshold
- Fail threshold
- Evidence generated
- Next decision

Prioritise experiments that test the highest-risk assumption.

Do not generate vague actions.

REPORT WRITING STYLE

Use professional business language.

Be direct.

Avoid promotional exaggeration.

Avoid unsupported certainty.

Explain technical terms.

Do not repeat the same finding across multiple sections.

Do not use the phrase “validated” unless the evidence supports it.

Do not use “accepted” as a verdict.

Do not hide weaknesses to make the idea appear attractive.

Do not automatically recommend building a full product.

Where evidence is weak, recommend customer discovery, manual testing, pre-orders, letters of intent, a concierge MVP or a limited pilot.

REQUIRED REPORT SECTIONS

Return only sections supported by available data.

Use this order:

1. Idea Overview
2. Validation Verdict
3. Validation Potential
4. Evidence Confidence
5. Evidence Summary
6. Critical Assumptions
7. Problem Validation
8. Customer Validation
9. Solution Validation
10. Demand Validation
11. Market Attractiveness
12. Market Size
13. Competition
14. Differentiation
15. Pricing and Revenue Model
16. Delivery and Fixed Costs
17. Unit Economics
18. Capacity and Operations
19. Founder Readiness

20. Risks
21. Contradictions
22. Validation Experiments
23. Recommended Simulations
24. 30-, 60- and 90-Day Roadmap
25. Final Decision Gate
26. Sources
27. Limitations
28. Disclaimer

FINAL DECISION GATE

Conclude with one principal recommendation:

- Reframe the problem
- Narrow the target customer
- Rework the solution
- Gather customer evidence
- Test willingness to pay
- Run a manual pilot
- Build a limited prototype
- Proceed to a controlled pilot
- Improve unit economics
- Resolve operational constraints
- Resolve regulatory constraints
- Prepare for scale assessment
- Pause the idea

The recommendation must be tied to the highest-risk unresolved assumption.

STRUCTURED RESPONSE REQUIREMENT

Return valid JSON conforming to the application schema.

Do not add commentary outside the JSON response.

Each section must include:

{

```
"title": "",  
"summary": "",  
"findings": [],  
"evidence_status": "",  
"confidence": 0,  
"sources": [],  
"limitations": []  
}
```

Each source must include:

```
{  
  "source_title": "",  
  "source_organisation": "",  
  "source_url": null,  
  "publication_date": null,  
  "accessed_at": null,  
  "claim_supported": "",  
  "evidence_status": ""  
}
```

Each numerical recommendation must include:

```
{  
  "metric": "",  
  "value": null,  
  "low_case": null,  
  "base_case": null,  
  "high_case": null,  
  "currency": null,  
  "period": null,  
  "formula": null,  
  "assumptions": [],  
  "evidence_status": "",  
  "sources": [],  
  "confidence": 0  
}
```

FINAL INTEGRITY CHECK

Before returning the response, confirm internally that:

- No number was invented.
- No URL was invented.
- No unverified claim was described as verified.
- The narrative matches the deterministic scores.
- Market calculations reconcile.
- TAM is not smaller than SAM.
- SAM is not smaller than SOM.
- Pricing models were not incorrectly mixed.
- Local ideas were not given unjustified global launch recommendations.
- Missing data was disclosed.
- Experiments have measurable thresholds.
- The verdict reflects both potential and evidence confidence.
- The highest-risk assumption is clearly identified.

Key product decision embedded in the prompt

The new engine separates three concepts that the current report risks combining:

- **Idea potential:** Does the concept appear commercially and operationally sensible?
- **Evidence confidence:** How much credible evidence supports that conclusion?
- **Validation stage:** What is the idea currently ready to do?

This prevents an attractive but unsupported idea from receiving an overly positive verdict, while also preventing an idea with limited evidence from being incorrectly dismissed.
