

EnterpriseAI Activation and Education Automation

Implementation brief and ready to use email sequence for Codex

Purpose. Convert eligible registered users who have not created a workspace into active users, then help them discover useful features through a continuing but bounded education programme. The first conversion event is workspace creation; the main value event is completion of Idea Validation or another meaningful task suited to the user. This document is a specification, not a claim that the current codebase already supports these events.

1 Outcome and scope

- Continuously enrol new eligible sign-ups. Include existing dormant accounts only after an eligibility and permission audit; do not restart completed sequences.
- Use behavioural triggers and actual database state. A click is not proof of activation. Stop or change the journey as soon as the user creates a workspace or completes a relevant task.
- Teach specific uses of the platform: Idea Validation, Scenario Intelligence, Business Blueprints, Catalogue, Financials, and Marketplace, only where the current plan and product permit them.
- Offer a direct route back to the exact screen needed. Use first name and declared goal only when present; fall back to neutral copy.

Success metrics: workspace creation within 7 and 14 days of eligible sign-up; first meaningful task completion within 14 days; time to first value; return visits at 30 days; paid conversion as a secondary metric. Monitor unsubscribes, complaints, bounces and support replies as guardrails.

2 Journeys and state transitions

Journey	Entry	Exit or transition
A No workspace	Verified account; no workspace; valid permission for the email category	Workspace created → B; unsubscribe, suppression, deletion or end of sequence → stop
B First value	Workspace created; no completed meaningful task	Validation or suitable task completed → C; goal changes → recalculate; inactivity or opt-out → stop email
C Continuing education	Active user who wants product tips and qualifies for marketing email	Send relevant tips at low frequency; stop on opt-out, suppression or prolonged inactivity

Suggested journey A schedule: shortly after verified sign-up, then 24 hours, day 3, day 6 and day 10. For historical accounts, begin at step 1 only when permission is established; spread the backlog into batches. Journey B: one task-specific guide after workspace creation, a reminder after 3 days if no task is complete, then one help request after 7 days. Journey C: at most two useful tips per month, selected from recent actions; do not send generic repetitions or upgrade pitches after every interaction.

3 Event and data contract

Before coding, inspect the actual authentication provider, user model, workspace schema, feature access rules, email sender, registration notice and consent records. Map these proposed names onto existing entities rather than duplicating them.

Entity	Minimum fields or events
User and permission	user_id, email, verified_at, locale/timezone, marketing_email_status, permission_source, collected_at, unsubscribe_at, suppression_reason
Product events	signed_up, workspace_created, validation_started, validation_completed, first_invoice_created, blueprint_created, marketplace_listing_created, last_active_at
Journey ledger	user_id, journey_key, step_key, due_at, state, attempt_count, provider_message_id, sent_at, stopped_reason, template_version

Delivery events	delivered, bounced, complained, suppressed, unsubscribed; click tracked only where permitted and needed
-----------------	---

Create a unique constraint on (user_id, journey_key, step_key). Event ingestion and sends must tolerate retries. The send worker must recheck permission, suppression, account status, workspace existence and step-specific conditions immediately before sending. Queue atomically, use an idempotency key where supported, and reconcile uncertain provider responses before retrying.

4 Scheduling and eligibility rules

- Run a scheduled selector at least hourly; use the existing job system, or Supabase Cron plus an Edge Function if that is already the production stack. Keep provider credentials server-side.
- Send between 09:00 and 18:00 in the user's known local timezone; use Europe/London as the default for UK users. Never send more than one activation email in 48 hours or alongside a recent product campaign.
- Exclude unverified, deleted, unsubscribed, suppressed, bounced or complained addresses. Apply the strongest applicable permission rule to each email category. Avoid deriving consent from account creation alone.
- On workspace creation, cancel all pending A messages. On first meaningful task, cancel pending B messages. A user with several workspaces must not re-enter A.
- Do not expose idea text, scores, financial figures or sensitive business data in an email unless the user deliberately requests that type of notification. Use a generic link back to the authenticated app.

5 Message library for journey A

Use [first name] only when known. All buttons should lead to the relevant authenticated deep link, preserve a safe return path after login, and include campaign attribution. Each message needs the sender identity and unsubscribe link in the footer. Verify the exact UI labels and feature limits before publishing.

A1 Welcome Send after verification

Subject: Your EnterprateAI workspace is ready

You have an EnterprateAI account. The next step is to create your workspace so your business information has one place to live. Start with your business name or working idea; you can build from there. Once your workspace is ready, you can explore the tools that fit what you are trying to do.

Button: Create my workspace

A2 First step 24 hours

Subject: A simple way to get started

You do not need a finished business plan to begin. Create a workspace, add a short description of the idea or business you want to work on, and choose one decision you want to make. If you are exploring a new idea, Basic Idea Validation is a useful first step. If you already trade, start with the part of your business you want to organise.

Button: Set up my workspace

A3 Demonstrate value Day 3

Subject: What could your first business insight reveal?

A promising idea still has questions to test: who needs it, how it might earn revenue, and what could make it difficult to deliver. EnterprateAI Idea Validation helps structure those questions and provides scores, risks and suggested next actions. Create your workspace to begin exploring your own idea. The output supports your judgement; it is not financial, legal or investment advice.

Button: Explore Idea Validation

A4 Two paths Day 6

Subject: Start where your business is today

Have an idea you have not launched? Begin with Idea Validation to test the assumptions behind it. Already running a business? A workspace can bring your catalogue, documents and financial activity into one place, with other tools available according to your plan. Choose the path that fits you and take one small step today.

Button: Choose my starting point

A5 Help Day 10

Subject: Can we help you take the first step?

We noticed that you have not created a workspace yet. If the set-up is unclear, reply to this email and tell us where you got stuck. If the timing simply is not right, that is fine. Your account is there when you are ready.

Button: Create my workspace

6 Message library for first value and continuing education

B1 Workspace created

Subject: Your workspace is set up choose your first result

Your workspace is ready. If you are testing a new idea, open Idea Validation and describe the problem, customer and proposed solution. If you are already operating, begin with a product or service in your catalogue or another task that matches your goal. Focus on one useful result today.

Button: Open my first task

B2 No first task after 3 days

Subject: One question worth answering this week

What decision are you facing now: whether an idea has demand, how a change might affect cash, or how to present your offer? Pick one question and use the relevant EnterprateAI tool. Your workspace keeps the information together so you can build on it later.

Button: Continue in my workspace

B3 No first task after 7 days

Subject: What would make EnterprateAI easier to use?

If you began setting up but have not completed a task, we would like to understand why. Reply with the one thing that stopped you, or use the help option in the app. We can point you to a practical starting route.

Button: Get help

C1 After validation completed

Subject: Turn your validation into a next step

Your report can help you decide what to test next. Review the strongest evidence gaps and prioritised actions, then use your workspace to refine the idea. You can also explore a Business Blueprint if it is available on your plan. Treat the report as decision support and verify important assumptions independently.

Button: Review my next steps

C2 For active operators with no simulation

Subject: What happens if one assumption changes?

A useful business decision often depends on a few variables. Scenario Intelligence can help you explore how a change in revenue, cost or client mix might affect projected results, where your plan includes access. Use a realistic assumption and compare it with your current position.

Button: Explore scenarios

C3 For invoice or catalogue users

Subject: Let the information you already entered do more

Your catalogue can hold the products and services behind your documents and financial activity. Check that descriptions, prices and costs are current, then explore how that information can support quotations or invoices in your workspace.

Button: Review my catalogue

Content engine. Store tips as reviewed templates tagged by persona, plan, completed actions, next eligible action, and last-sent date. Select the next tip only when the user has access to its feature and has not already completed the suggested action. The editorial owner can add or retire tips without changing scheduling code; require review and versioning before activation. Use real anonymised product demonstrations only with permission. Never invent testimonials, customer counts or guaranteed outcomes.

7 Permission and delivery controls

The UK ICO treats messages encouraging use of a service as likely direct marketing, even when presented as onboarding. Codex must inspect the sign-up flow and stored permission evidence before importing dormant users. For individual subscribers, use a valid consent or applicable soft opt-in only where its conditions, including an opt-out at collection and in each message, were met. Keep essential account messages separate from promotional journeys. Record the lawful basis and privacy notice treatment with the team's adviser; make suppression effective immediately. Sources: ICO electronic mail marketing and identification guidance at ico.org.uk/for-organisations/direct-marketing-and-privacy-and-electronic-communications/.

Configure SPF, DKIM and DMARC for the sending domain; distinguish product notifications from marketing lists. Process provider webhooks for bounces, complaints and suppressions. Provide a one-click unsubscribe link, preference page, and clear support address. Do not depend on tracking pixels as the success measure.

8 Measurement and experiments

Create a dashboard showing eligible users, sent and delivered by step, workspace creations, first tasks, 7-day and 14-day activation, unsubscribes, complaints and paid conversion by cohort. Attribute conversions to exposure with a small eligible random holdout, because users can activate without opening an email. Review subject lines and first-action links first. Test one substantive change at a time, with a documented start date and stopping rule. Investigate low activation as possible onboarding friction, not merely copy performance.

9 Acceptance criteria for Codex

- New verified and eligible users with no workspace enter A automatically; historical users enter only after permission review, and batches are rate limited.
- Creating any workspace before a due step prevents that step and all later A steps; task completion prevents B reminders; retries cannot duplicate sends.
- Every link resolves to the intended screen after authentication; permissions and plan access are checked before a feature-specific tip.
- Unsubscribe, complaint, bounce, deletion and provider suppression stop promotional sends immediately across journeys.

- Administrators can inspect a user's journey state, sent template version, delivery status, permission evidence and stop reason without seeing sensitive business content.
- Dry-run mode reports who would receive each step and why. Automated tests cover state changes just before send, duplicate jobs, webhook retries, timezone windows and opt-outs.
- A staged rollout begins with an internal test cohort, then a small eligible cohort, then all eligible future sign-ups after metrics and deliverability review.

10 Codex execution instruction

Inspect the existing EnterprateAI repository and deployment architecture first. Return a short mapping of existing auth, workspace, activity tracking, email delivery and permission capture. Implement the state machine, event capture, scheduler, templates, webhooks, preferences, admin observability and dashboard using existing project conventions. Keep schema changes reversible. Supply migrations, tests, environment variable names without secrets, rollout steps and a short demonstration of a user who activates between scheduling and delivery. Flag any claim or deep link that the live product does not support and substitute accurate copy before launch.

Source hierarchy used: EnterprateAI GTM Knowledge Base and accompanying system prompt for product, voice and metrics; EnterprateAI Advertising Brief for campaign-specific positioning. Feature availability, technical stack and registration permission remain to be verified in the live application.
