

**EnterprateAI**

# **Adaptive Dashboard**

Product Requirements Document

**Version 1.0 - Draft for Review**

## **Status**

This is Version 1 of the Adaptive Dashboard PRD. It captures the current agreed product direction and UI design, but remains a draft until formally adopted by Enterprate Limited.

1 October 2026

| Field               | Value                                                                   |
|---------------------|-------------------------------------------------------------------------|

## 2. Executive Summary

The Adaptive Dashboard is the primary decision-intelligence surface of EnterprateAI. It must preserve the current clean, low-clutter dashboard experience while progressively surfacing the information, recommendations, approvals and agent-supported actions that matter most to the business at that moment.

The dashboard is not a new reporting layer and must not become a collection of every available feature. It composes authoritative business data, assessments, risks, recommendations, scenarios, operational records and agent activity into a concise working view. Capabilities that are not currently prioritised remain discoverable through a secondary Tool Library in the left navigation.

### Core product question

What matters most to this business right now, what needs attention, and what can EnterprateAI help the user do next?

## 3. Product Problem

EnterprateAI now spans planning, business operations, decision intelligence, readiness checks, simulations, marketplace workflows and agentic execution. If every capability is represented equally on the dashboard, the product becomes visually crowded and cognitively expensive for the business owner.

The dashboard therefore needs to remain familiar and simple while adapting its insights, actions and priorities to the user's business context. The user should not have to understand which engine or module produced an insight before knowing what to do next.

## 4. Product Objectives

| Objective                 | Requirement                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Preserve simplicity       | Retain the current spacious dashboard structure; avoid dense widget grids.                                                             |
| Preserve full tool access | Provide a Tool Library in the left navigation so users can manually browse and open all entitled tools without crowding the dashboard. |

| Objective                       | Requirement                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Surface priorities              | Show critical risks, time-sensitive approvals, chosen goals and the next most useful insight first.                     |
| Integrate the Agent             | Place the EnterprateAI Agent near the top of the page as an execution and assistance surface.                           |
| Keep one AI experience          | The existing AI Assistant remains the conversational interface; agent execution runs behind the same experience.        |
| Support free-to-paid conversion | Free users may use limited Agent actions from their 50 AI Credits; paid plans unlock sustained and advanced automation. |
| Remain extensible               | The Agent surface must not be designed around one fixed workflow because its task range will expand.                    |
| Be voice-ready                  | The dashboard input surface should be able to accept future voice prompts without redesigning agent orchestration.      |
| Protect source of truth         | Dashboard presentation must never replace or modify authoritative engine calculations.                                  |

## 5. Non-Goals

- A general-purpose BI dashboard builder.
- A replacement for Business Operations, accounting or CRM.
- A separate dashboard score store duplicating authoritative assessments.
- A page containing every feature, engine or report simultaneously.
- A separate chatbot for the Agent.
- A dashboard where an LLM invents business metrics or overrides engine outputs.

## 6. Adaptive Context Model

Dashboard composition must evaluate four independent product dimensions. A fifth context signal - the user's Current Goal - may influence priority, but must not change the underlying business stage or account scope.

| Dimension                  | Examples                                      | Effect on dashboard                                        |
|----------------------------|-----------------------------------------------|------------------------------------------------------------|
| Business stage             | Idea, pre-launch, startup, operating, growth  | Controls default priorities and available readiness views. |
| Account scope              | Single business, multi-entity                 | Controls entity-level versus portfolio-level composition.  |
| User role                  | Owner, admin, authorised member               | Controls visibility, approvals and actions.                |
| Subscription / entitlement | Free, paid plans                              | Controls advanced intelligence and Agent capacity.         |
| Current goal               | Launch, funding, cash, growth, risk reduction | Boosts relevance of related insights/actions.              |

## 7. Dashboard Pathways

| Pathway | Default priorities | Supporting views |
|---------|--------------------|------------------|
|---------|--------------------|------------------|

| Pathway        | Default priorities                                               | Supporting views                                                     |
|----------------|------------------------------------------------------------------|----------------------------------------------------------------------|
| Startup        | Next actions, launch blockers, viability, forecast cash position | Funding preparation, business plan, scenarios, business operations   |
| Small Business | Cash and risk alerts, operational actions, recommendations       | Fragility Index, simulations, funding, growth, new launches          |
| Multi-Entity   | Exceptions requiring attention, approvals, entity comparison     | Business drill-down, readiness status, scenario and action summaries |

Changing pathway must not recreate or duplicate the business. An operating business can still use Idea Validation or create a new launch initiative. Business Operations remain accessible regardless of dashboard pathway where the user is entitled. The Tool Library remains a stable secondary navigation destination across pathways so users can manually discover and open available capabilities even when they are not surfaced on the Adaptive Dashboard.

The current production dashboard design is the visual baseline. The objective is enhancement, not wholesale replacement. The dashboard should remain airy, card-based and easy to scan.

## 8.1 Adopted page hierarchy

- 1. Persistent left navigation with Dashboard and Tool Library as primary access points.
- 2. Page header and dashboard context.
- 3. EnterprateAI Agent + Needs Approval near the top.
- 4. Existing Launchpad / key action cards such as Essentials, Validate My Idea and Run Scenarios.
- 5. Current Financial Performance & Health metrics.
- 6. Adaptive Insights for Your Business.
- 7. One Business Health Report entry at the bottom.

## 8.2 Wireframe structure

| HEADER   Adaptive Dashboard context and business status                                                                  |                               |                                                                                          |                      |
|--------------------------------------------------------------------------------------------------------------------------|-------------------------------|------------------------------------------------------------------------------------------|----------------------|
| <b>ENTERPRATEAI AGENT</b><br>Tasks, alerts, suggestions, prompt input and next best actions. No fixed workflow timeline. |                               | <b>NEEDS APPROVAL</b><br>Quotes, reminders, receipts, risk reviews and future approvals. |                      |
| <b>Essentials</b>                                                                                                        | <b>Validate My Idea</b>       | <b>Run Scenarios</b>                                                                     |                      |
| CURRENT FINANCIAL PERFORMANCE & HEALTH   compact KPI row                                                                 |                               |                                                                                          |                      |
| <b>Recommended Next Step</b>                                                                                             | <b>Fragility / Risk Alert</b> | <b>Suggested Scenario</b>                                                                | <b>Cash Position</b> |
| BUSINESS HEALTH REPORT   single report entry                                                                             |                               |                                                                                          |                      |

### UI principle

The dashboard should adapt by changing the content and priority of a small number of surfaces - not by continuously adding more cards.

## 8.3 Reports simplification

The previous group of separate report links should be removed from the main dashboard. Retain one Business Health Report entry that acts as the comprehensive drill-down for scores, risks, recommendations and next actions. Specialist reports may still exist within their relevant modules or report area.

## 8.4 Tool Library in the Left Navigation

The Tool Library is a secondary access layer, not a dashboard card. It should appear as a persistent item in the left navigation, directly accessible from any dashboard pathway. Its purpose is to let users browse and manually open all tools available to their account, including capabilities that the Adaptive Dashboard has not prioritised at that moment.

| Principle           | Requirement                                                                                                                                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Navigation position | Place Tool Library on the left navigation near Dashboard. Recommended hierarchy: Dashboard → Tool Library → Plan → Operate → Sell → Intelligence → Agents, mapped to the current production navigation during implementation. |

| Principle              | Requirement                                                                                                                                                                        |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dashboard relationship | The Adaptive Dashboard decides what deserves attention now; the Tool Library provides on-demand access to the full entitled capability set.                                        |
| Entitlements           | Show only tools the user can access, plus optional clearly labelled locked/upgrade states where commercially appropriate. Never expose restricted data merely to render an upsell. |
| Discovery              | Support search, grouping and concise descriptions so users can find a capability without knowing its internal module or engine name.                                               |
| Continuity             | Opening a tool must use the same business context and authoritative records; it must not create a duplicate business or separate data silo.                                        |

### Product rule

Dashboard = what EnterprateAI recommends the user focus on now. | Tool Library = all available tools the user may choose to open manually.

## 9. EnterprateAI Agent on the Dashboard

The Agent should be positioned near the top of the dashboard because it becomes the user's action surface: the place where insights can turn into work. It should not sit at the bottom as a secondary feature.

### 9.1 One AI experience

The existing AI Chatbot/Assistant and the Agent must not appear as competing products. The Assistant is the conversational interface; Agentic Orchestration is the execution capability behind it.

| User intent                            | Experience                                                                                  |
|----------------------------------------|---------------------------------------------------------------------------------------------|
| "Why is my Fragility risk increasing?" | Assistant explains the underlying drivers and evidence.                                     |
| "Prepare a quotation for ABC Ltd."     | The same interface recognises an executable task and starts the appropriate Agent workflow. |
| "Remind overdue customers."            | Agent prepares or executes the permitted payment follow-up workflow.                        |
| "What happens if I lose Client A?"     | Assistant/Agent initiates the deterministic scenario engine and explains the result.        |

### 9.2 Agent panel content

The Agent panel must remain general-purpose. Do not show a permanent Enquiry → Quote → Approval timeline because the Agent's responsibilities will expand across commercial, financial, risk and decision workflows.

| Surface         | Examples                                         |
|-----------------|--------------------------------------------------|
| Task summaries  | "I found 2 items that need review."              |
| Prepared work   | "A draft quotation for BrightTech Ltd is ready." |
| Risk assistance | "Customer concentration risk is rising."         |

| Surface              | Examples                                                                                                    |
|----------------------|-------------------------------------------------------------------------------------------------------------|
| Suggested action     | “Would you like me to prepare a payment follow-up?”                                                         |
| Prompt input         | “Ask EnterprateAI to help with quotes, payments, risks or scenarios...”                                     |
| Capability shortcuts | Enquiry to Quote, Quote to Invoice, Payment Follow-up, Receipt Sending, Risk & Concentration, Scenario Help |

### 9.3 Needs Approval panel

A compact Needs Approval panel sits beside the Agent surface. It shows only actions requiring user attention. Examples include a quotation ready to send, payment follow-up draft, receipt ready to send, contract action or risk-related recommendation requiring confirmation.

### 9.4 Free and paid access

The dashboard must not treat the Agent as completely unavailable to Free users. Free users receive 50 AI Credits and may use those credits for limited Assistant and Agent activity. This gives users a real experience of the execution value before upgrade.

| Plan behaviour   | Requirement                                                                                                                  |
|------------------|------------------------------------------------------------------------------------------------------------------------------|
| Free             | 50 AI Credits shared across eligible AI Assistant and limited Agent actions. Usage is capped by credits and workflow limits. |
| Paid             | Higher Agent capacity, sustained workflows and advanced automation according to plan entitlement.                            |
| Upgrade trigger  | Show remaining credits and contextually explain which workflow would continue or unlock after upgrade.                       |
| No dark patterns | Do not block a Free user from understanding why an action is restricted; explain entitlement clearly.                        |

### 9.5 Voice-ready UI

Voice prompt support is not required for this dashboard release, but the Agent input component must be designed so a microphone/voice control can be added without changing the underlying workflow model. Text and future voice input should resolve into the same goal/intent contract before reaching Agentic Orchestration.

The dashboard should therefore avoid assumptions that executable requests originate only from typed chat. The UI may reserve space for a future voice affordance, while all permissions, approvals and business-scope checks remain channel-independent.

## 10. Adaptive Insights

The dashboard should surface a small number of adaptive insights based on authoritative data and assessments. These cards change content according to business context but should not constantly rearrange for minor data changes.

| Insight family         | Example                               | Primary action                        |
|------------------------|---------------------------------------|---------------------------------------|
| Recommended Next Step  | Receivables are slipping past terms.  | Run scenario / prepare follow-up      |
| Fragility / Risk Alert | Two customers make up 68% of revenue. | View risk details / ask Agent to help |
| Suggested Scenario     | Test a 10% cost increase.             | Run scenario                          |
| Cash Position          | 5.2 months runway at current burn.    | View cash forecast                    |

| Insight family           | Example                     | Primary action                           |
|--------------------------|-----------------------------|------------------------------------------|
| Launch / Funding blocker | Mandatory evidence missing. | Complete evidence / ask Agent to prepare |

## 10.1 Primary priority order

1. Critical risks or blockers.
2. Time-sensitive approvals or actions.
3. The user's current goal.
4. Recommended next action.
5. Supporting insight or opportunity.

The five-card rule applies to adaptive/priority surfaces, not to compact financial KPI tiles. Financial KPI tiles may remain as a separate concise summary row.

## 10.2 Stability rule

The dashboard must not continuously reorder itself. Recomposition should occur when a material event changes priority: a critical risk appears, severity changes, an item is resolved, an approval becomes time-sensitive, a selected goal changes, a source assessment becomes stale, or an entitlement changes.

## 10.3 Explainability

Material changes should be explainable. A risk card should be able to answer “Why am I seeing this?” using the underlying evidence and assessment output. The dashboard may use LLM-generated narrative for explanation, but the authoritative numeric result remains engine-owned.

# 11. Dashboard Composition Model

The dashboard is a composition service over authoritative business and intelligence data. It should not create another permanent score store.

| Source                       | Dashboard use                                               |
|------------------------------|-------------------------------------------------------------|
| Business / BusinessProfile   | Business stage and context                                  |
| Financial data               | Revenue, cash, expenses, receivables                        |
| Assessment / AssessmentScore | Viability, survival, stability, growth and readiness status |
| RiskFlag                     | Risk and Fragility alerts                                   |
| Recommendation               | Next actions and improvement suggestions                    |
| Interpretation               | Readable explanation                                        |
| Scenario / SimulationResult  | Suggested scenarios and outcomes                            |
| ActionItem                   | Outstanding follow-through                                  |
| Agent WorkflowRun / Approval | Agent tasks and approvals                                   |
| Entitlements / AI Credits    | Feature access and remaining capacity                       |

## 11.1 Proposed WidgetDefinition

Conceptual fields: widget\_id, version, widget\_type, title, supported\_pathways, eligible\_business\_stages, required\_sources, required\_permissions, required\_entitlements, priority\_class, supported\_actions, active\_flag.

Conceptual fields: user\_id, business\_id, pinned\_widget\_ids, hidden\_widget\_ids, current\_goal, preferred\_layout, created\_at, updated\_at. Preferences affect presentation only; they do not change business intelligence.

### 11.3 AgentSummary surface

The Agent panel should be driven by a computed summary of active/recent WorkflowRuns, pending approvals, relevant recommendations and supported next actions. Do not hard-code one workflow sequence into the dashboard component.

## 12. UX States

| State             | Expected behaviour                                                                  |
|-------------------|-------------------------------------------------------------------------------------|
| Loading           | Use a compact skeleton; avoid shifting the full page.                               |
| Available         | Show current result and primary action.                                             |
| Empty             | Explain that no applicable item currently exists.                                   |
| Insufficient data | Explain which input is missing; never fabricate a value.                            |
| Stale             | Show freshness reason/timestamp and refresh action.                                 |
| Failed            | Isolate failure to the affected card/panel; keep valid dashboard content available. |
| Restricted        | Explain entitlement or permission limitation.                                       |
| Credits exhausted | Show upgrade path while preserving existing records and non-Agent functions.        |

## 13. Permissions and Entitlements

Permission checks apply at the service/data boundary, not only in the interface. The Agent panel must display only workflows and approvals the current user is authorised to see or act upon.

| Capability                    | Owner/Admin        | Authorised member     | Free user                                             |
|-------------------------------|--------------------|-----------------------|-------------------------------------------------------|
| View dashboard insights       | Yes                | Scoped                | Yes where feature is free/eligible                    |
| Use AI Assistant              | Per plan           | Per plan              | Uses AI Credits                                       |
| Use limited Agent actions     | Yes                | Role + plan dependent | Yes, within 50 AI Credits and free limits             |
| Approve external Agent action | Role policy        | If authorised         | Only if the workflow is permitted by free entitlement |
| View another entity           | Only if authorised | Only if authorised    | No cross-entity access without scope                  |

## 14. API and Event Dependencies

Conceptual dashboard endpoint: GET /businesses/{business\_id}/dashboard. The response should be composed from authoritative services and include context, financial summary, adaptive insights, Agent summary, pending approvals, freshness and entitlement state.

Relevant events include BusinessDataChanged, EvidenceUpdated, AssessmentCompleted, AssessmentInvalidated, RecommendationCreated, ActionCompleted and WorkflowStatusChanged. The dashboard should refresh affected surfaces rather than rebuilding every module after every event.

## 15. Instrumentation

| Metric                               | Purpose                                            |
|--------------------------------------|----------------------------------------------------|
| Time to first useful insight         | Measures how quickly the dashboard delivers value. |
| Adaptive card open rate              | Tests relevance of surfaced insights.              |
| Recommendation → action conversion   | Measures follow-through.                           |
| Recommendation → scenario conversion | Measures decision testing.                         |
| Agent prompt / workflow starts       | Measures Agent adoption.                           |
| Approval completion                  | Measures task progression.                         |
| Free AI Credits consumed             | Measures trial value and upgrade timing.           |
| Upgrade after Agent usage            | Measures conversion from experienced Agent value.  |
| Risk / blocker resolution            | Measures business outcome, not just engagement.    |
| Weekly dashboard return rate         | Measures ongoing usefulness.                       |

## 16. Migration and Rollout

Implementation must be additive and preserve the existing dashboard and Business Operations while the new composition logic is introduced.

| Stage                | Expected outcome                                                                                     |
|----------------------|------------------------------------------------------------------------------------------------------|
| Production inventory | Confirm current dashboard routes, components, schemas, entitlements, AI credit logic and Agent APIs. |
| Feature flag         | Introduce Adaptive Dashboard components behind a controlled flag.                                    |
| Startup pilot        | Validate Launch Readiness + Startup pathway.                                                         |
| Small Business pilot | Validate funding/risk/financial composition and Agent surface.                                       |
| Agent integration    | Expose task summaries and approvals from Agentic Orchestration.                                      |
| Multi-Entity         | Add exception-led portfolio view after entity isolation is validated.                                |

## 17. MVP Scope

| Included in V1                                                   | Deferred / later                                |
|------------------------------------------------------------------|-------------------------------------------------|
| Startup and Small Business pathways                              | Full Multi-Entity experience                    |
| Tool Library in left navigation with entitlement-aware discovery | User-built marketplace / third-party tool store |

| Included in V1                      | Deferred / later                     |
|-------------------------------------|--------------------------------------|
| Current clean dashboard structure   | User-built custom dashboard designer |
| Agent panel near top                | Fully autonomous agent execution     |
| Needs Approval panel                | Advanced portfolio consolidation     |
| Financial KPI summary               | External benchmarking                |
| Adaptive Insights                   | Predictive ML ranking                |
| One Business Health Report          | Multiple dashboard report lists      |
| Free 50-credit limited Agent access | Unlimited free automation            |
| Voice-ready input architecture      | Voice prompt launch itself           |

## 18. Acceptance Criteria

1. The dashboard retains the current clean visual hierarchy and does not become a dense grid of modules.
2. A Tool Library is available from the left navigation as a secondary destination for browsing and manually opening all entitled EnterprateAI tools.
3. Tools not prioritised on the dashboard remain discoverable through the Tool Library without creating duplicate business records or separate data stores.
4. The EnterprateAI Agent is positioned near the top of the main dashboard.
5. The Agent panel does not use a permanent workflow timeline tied to Enquiry-to-Quote.
6. The Agent panel can surface tasks, risks, recommendations, approvals and prompts from multiple workflow families.
7. The existing AI Assistant and Agent present as one AI experience; execution is routed through Agentic Orchestration when required.
8. Free users can consume their 50 AI Credits on eligible Assistant and limited Agent activity.
9. Paid entitlements provide higher Agent capacity and advanced automation without creating a separate Agent product experience.
10. A future voice prompt can enter the same intent/goal contract without redesigning orchestration or permissions.
11. Critical risks and time-sensitive approvals outrank routine insights.
12. Missing or stale data is displayed explicitly; values are not fabricated.
13. Existing Business Operations remain accessible.
14. Only one Business Health Report entry appears on the main dashboard.
15. Dashboard changes do not alter engine-owned scores or live simulation baselines.
16. Permission checks prevent cross-entity data leakage in dashboard, Agent summaries and approvals.
17. Existing invoice, quotation, contract and dashboard journeys continue to function during rollout.

## 19. Definition of Done

- Startup and Small Business dashboard compositions work from production data.
- Tool Library is present in the left navigation, uses entitlement-aware discovery, and opens tools in the current business context.
- Agent panel and Needs Approval panel are connected to authorised Agentic Orchestration records.
- Adaptive Insights follow the defined priority rules and show explainable evidence.
- Free AI Credit behaviour and paid entitlements are enforced server-side.
- Business Health Report replaces the multiple-report list on the dashboard.
- Voice-ready input contract is documented and the UI component does not assume text-only requests.
- UX states, analytics, permissions and migration acceptance tests pass.
- The previous dashboard can be rolled back through feature flags without destructive data migration.

## 20. Open Decisions Before Formal Adoption

| Decision                                     | Owner / note                                                       |
|----------------------------------------------|--------------------------------------------------------------------|
| Exact AI Credit cost per Agent action        | Product + Finance; define before commercial rollout.               |
| Free workflow limits beyond credits          | Product; e.g. number of sends/automations allowed.                 |
| Paid plan Agent allowances                   | Product / Commercial.                                              |
| Exact Current Goal taxonomy                  | Product.                                                           |
| Final user role names / approval authority   | Product + Engineering.                                             |
| Authoritative Fragility Index implementation | Product / Intelligence; verify before reuse.                       |
| Voice launch timing and speech provider      | Future product/engineering decision; architecture is prepared now. |
| Performance budgets                          | Engineering after production baseline measurement.                 |

## 21. Reference Product Model

### Product hierarchy

Ontology = what EnterprateAI knows. | Engines = what EnterprateAI calculates. | Adaptive Dashboard = what deserves attention. | Assistant = how the user converses. | Agentic Orchestration = how approved work gets done.

This separation keeps EnterprateAI centred on decision intelligence while giving users a clear path from understanding the business to taking action, without overloading the dashboard or creating duplicate AI experiences.

## Appendix A - UI Design Notes

Adopted visual direction: retain the current EnterprateAI dashboard layout, spacing, left navigation, card style and compact KPI presentation. Add Tool Library as a persistent left-navigation item near Dashboard, without adding a Tool Library card to the main dashboard. Place the Agent + Needs Approval block immediately after the dashboard header. Keep the launch/action cards, financial summary and adaptive insights below. Reduce the reports area to one Business Health Report row.

The Agent panel should use a general task-and-prompt pattern rather than a fixed workflow progress graphic. This is necessary because future tasks will include enquiry-to-quote, quote-to-cash, payment follow-up, receipt sending, client concentration, risk response, scenario support, readiness actions and additional agentic workflows.

## Appendix B - Source and Architecture Alignment

This PRD aligns to the EnterprateAI Shared Architecture and Feature Integration Blueprint v0.1, which defines the three dashboard pathways, separation of business stage/account scope/role/subscription, a maximum of five primary priority cards, preservation of Business Operations, dashboard composition from authoritative results, permission-aware aggregation, and integration with Agentic Orchestration. Product decisions captured during subsequent design review are incorporated here as Version 1.0 draft requirements.
